REV.

HOLE NO. D-1

HOLE LOCATION UPPER EAST FORK	HOLE ELEVATION 1020	ANGLE VERTICAL BEARING ---	
DRILL RIG JOY	CORE SIZE NX (2")	LOGGED BY RB/DH	DATE DRILLED 2/9/67 to 2/15/67

COMMENTS	DEPTH	DESCRIPTION
Core recovered as broken fragments 1"-3" size.	0	0-11.0 BASALT FLOW BRECCIA; fragments of basalt in a matrix of greenish brown crystalline olivine basalt porphyry.
Core recovered in 4"-1' lengths.	5	
Core recovered in 6"-8" lengths.	11	11-23 BASALT FLOW ROCK, with a few included fragments of basalt in a matrix, as above.
	23	23-40 OLIVINE BASALT PORPHYRY FLOW ROCK; 1-2 mm size olivine phenocrysts scattered through a matrix of gray very fine-grained crystalline basalt. Rock is massive but is cut by an irregular network of tight chlorite-lined fractures. Calcite fills some irregular fractures and fresh pyrite is present along some fracture surfaces.
Difficult drilling in fractured rock.	35	
	40	40-99.2 BASALT FLOW BRECCIA; same as rock in 0-11' interval.
	50.4	(50.4) Fractured zone, partly filled by calcite.
	55	(55.0) Fracture.
	62	(62.0) Gash fracture.
	68	(68.0) Gash fracture.
	70	(70-72) Clay-chlorite-healed breccia zone.
	72	(72-74) Fractured zone.
	99.2	BOTTOM OF HOLE = 99.2 FEET

HOLE NO. D-1

HOLE NO. D-2

HOLE LOCATION UPPER EAST FORK	HOLE ELEVATION 1050	ANGLE VERTICAL BEARING ---	
DRILL RIG JOY	CORE SIZE NX	LOGGED BY RB/DH	DATE DRILLED 2/16/67 to 2/21/67

COMMENTS	DEPTH	DESCRIPTION
0-4.5 Drilled with roller bit.	0	0-100.3 OLIVINE BASALT PORPHYRY FLOW ROCK; 1-2 mm size olivine phenocrysts scattered through a matrix of gray very fine-grained crystalline basalt.
	5	(5.0-7.0) Parallel fractures, dipping 15-20°
	8	(8-23) Rock cut by clean, individual fractures, dipping 45-60°, at 6"-18" intervals.
	20	(20) Fracture.
	23	(23-27) Rock crushed and partially altered to clay; cut by fractures at 2"-1' intervals.
	27	(27-100.3) Rock cut by a network of irregular intersecting closed chlorite-lined fractures.
	33	(33) Fracture.
	37	(37-38.5) Rock closely fractured.
	42	(42-43) Fracture Zone.
	56	(56-56.9) Fracture Zone.
	64.5	(64.5-65.6) Fracture Zone.
	70	(70-70.4) Fracture Zone.
	80	(80-80.5) Fracture Zone
	82	(82-83.0) Fracture Zone
	90.4	(90.4-91) Fracture Zone.
	100.3	BOTTOM OF HOLE = 100.3 FEET

HOLE NO. D- 2

HOLE NO. D-3

HOLE LOCATION UPPER EAST FORK	HOLE ELEVATION 990	ANGLE VERTICAL BEARING ---	
DRILL RIG JOY	CORE SIZE NX	LOGGED BY RB/DH	DATE DRILLED 2/21/67 to 2/27/67

COMMENTS	DEPTH	DESCRIPTION
Hole drilled with roller bit to 10' depth.	0	0-3 DOZED FILL; rocky clayey sand.
	3	3-7 ALLUVIAL AND SLOPEWASH SOIL; rocky clayey sand.
Core recovered in 6"-5' lengths; rock very sound.	7	7-98 BASALT FLOW BRECCIA; fragments of basalt and other volcanic rock types in a matrix of light gray dense crystalline olivine porphyry basalt. The proportion of the rock consisting of included fragments varies from 5% to 30-40%. Fragments range from 1/4" to 1' in size.
	58.5	(58.5) Calcite veinlet.
	77	(77-80) Possible flow layering shown by oxidized zones of fine-grained basalt in medium-grained crystalline basalt, dipping 10-15°.
	90.5	(90.5) Calcite veinlet.
	98	98-100 OLIVINE BASALT PORPHYRY FLOW ROCK.
	100	BOTTOM OF HOLE = 100.0 FEET

HOLE NO. D-3

NOTES

1. The subsurface information shown in the hole logs presented on this drawing indicate conditions found only on the date and at the location of the hole.
   Users of this information are cautioned that the Engineer and W.A. Wahler and Associates in no way warrant that that such information is representative of conditions at any other location, or at any other time. Strata, lithology, and other conditions may change between holes due to dipping of strata, folds and / or faults or other causes. Groundwater levels are subject to change with time, depending on precipitation and surface and subsurface runoff, etc.
2. The subsurface exploration program was carried out to provide a basis for the design of the works presented in these plans and specifications. Reasonable continuity between points of known data was assumed for design purposes. If conditions differing substantially from those shown are encountered, the Engineer shall be notified to permit modified recommendations and / or designs to be made before work progress precludes such modifications.
3. Only logs of borings shown on drawing number 5 are included in these plans.

HOLE LOCATION NORTH RIM RIDGE | HOLE ELEVATION 1030 | ANGLE VERTICAL | BEARING ---

DRILL RIG CHICAGO PNEUMATIC 8 | CORE SIZE NX | LOGGED BY LC/DH | DATE DRILLED 8/10-24/67

COMMENTS	DESCRIPTION
0-5° Core drilled to 3" diameter, recovered in 2-10 inch lengths	0-52.0 LAPILLI AND LITHIC TUFF BRECCIA; Grey-white color, clasts of hard grey-brown, fine-grained volcanic rock to 2" size, in a matrix of dense, firmly cemented, very fine-grained tuff.
	(5.0-12.5) Massive, fine-grained tuff; very few clasts.
	(8.5-9.5) Closely fractured zone.
	(16.0-16.5) Closely fractured zone.
	(31.0-32.0) Closely fractured zone; core in 1/4" - 1" size fragments.
	(32.0-51.8) Lithic tuff breccia - 1/2 to 1-1/2" size clasts in a matrix of fine to medium grained lithic tuff.
	(48.0) Color changes from light grey to grey tan; matrix becomes medium-grained lithic tuff.
	(51.8) Fault gouge, sheared lithic tuff.
	(52.0) Flat, polished shear plane.
Basalt core broken to 1/4" to 1" size fragments.	52.0-90.5 BASALT; Greenish gray, medium to coarse grained, crystalline, with inclusions of dark grey basalt. Matrix basalt is altered and crumbly.
	(61.5) Shear plane, vertical.
	(63.5) Shear plane, dipping 70°
	BOTTOM OF HOLE = 97.0 FEET

HOLE NO. D-8

HOLE LOCATION HILL 1116 SADDLE | HOLE ELEVATION 1019 | ANGLE VERTICAL | BEARING ---

DRILL RIG CHICAGO PNEUMATIC 8 | CORE SIZE NX | LOGGED BY LC/DH | DATE DRILLED 8/25-9/5/67

COMMENTS	DESCRIPTION
Core recovered in 1 to 6" lengths.	0-34.5 BASALT FLOW BRECCIA; Inclusion fragments of grey-brown and dark grey massive and vesicular basalt in a matrix of mottled grey, greenish grey, and dark grey, medium-grained crystalline basalt. Rock is moderately weathered.
	35.4-55.5 BASALT PORPHYRY FLOW ROCK; Light to dark grey, massive, fine-grained crystalline basalt, with 1 to 2 mm size phenocrysts of a greenish, cleavable mineral, probably a pyroxene. Rock is pervasively fractured, with clay and chlorite lining on fracture surfaces. Fractures tend to open when core is exposed.
	(47.4) Flat shear plane, dipping 70°, with slickensiding across surface dipping 10°.
	(48.8) 1/8" thick fault gouge, dipping 60°.
Core mostly recovered as blocky. 1/16 to 1/8-inch fragments.	55.0-66.5 BASALT FLOW ROCK; Dark greyish-green, altered and partially decomposed to clayey material, pervasively fractured where recovered intact.
Core recovered in 6 inch to 2 foot lengths	66.5-90.5 BASALT FLOW ROCK; Some breccia inclusions, dark red (primary oxidized zone) down to 70' depth.
	Light greenish grey below 70', massive, medium-grained, crystalline. Mostly sound rock.
	BOTTOM OF HOLE = 90.5 FEET

HOLE NO. D- 9

HOLE LOCATION EAST RIM RIDGE | HOLE ELEVATION 1040 | ANGLE VERTICAL | BEARING ---

DRILL RIG CHICAGO PNEUMATIC 8 | CORE SIZE NX | LOGGED BY LC/DH | DATE DRILLED 9/6-12/67

COMMENTS	DESCRIPTION
0-10° Hole drilled with roller bit; hole cased.	0-8.0 DOZED ROAD FILL AND TOPSOIL
Core recovered in 2 inch to 2 foot sections; most breaks caused by drilling.	8.0-90.0 LAPILLI TUFF BRECCIA; Light grey; angular to sub-rounded clasts of various volcanic rock types, predominantly of 1/4 to 1" size, in a firmly indurated matrix of fine-grained vitric and crystal tuff.
	(17.9) Fracture dipping 70-80°.
	(20.0) Irregular fracture dipping 70°.
	(33.0) Parallel fractures, slickensided, dipping 80°.
Core recovered in 1 to 6 inch sections, and fragments of sections. Most breaks caused by drilling	(53.0) Matrix becomes more clayey and clay seams or lenses present in rock.
	(58.5) Fracture
	(60.5) Fracture

COMMENTS

Cored with 2 7/8 inch O.D. Diamond bit.

Water Test #1 10'-20' No loss
Water Test #2 10'-20' Loss due to jacking
Water Test #3 10'-20'. Loss due to rock heaving.

Water Test #4 20'-35' No loss
Water Test #5 same interval as #4. Higher pressure, no loss
Water Test #6 same interval as #5. Higher pressure, no loss
Water Test #7, 8, 9, unable to seat packer.
Water Test #10 35'-65' No loss
Water Test #11 same interval as #10, higher pressure, no loss.
Water Test #12 same interval as #11, higher pressure, no loss.
Water Test #13 50'-65' No loss
Water Test #14 same interval as #13, higher pressure, no loss.
Water Test #15, same interval as #14, higher pressure, no loss.

Set casing to 70 feet.

Water Test #16 75'-90' No loss
Water Test #17 same interval as #16, higher pressure, no loss.
Water Test #18 same interval as #17, higher pressure, no loss.

Water Test #19 90'-110' Loss approximately 2gpm.
Water Test #20 same interval as #19, higher pressure, loss approximately 4.5gpm. Fractures slightly jacked.
Water Test #21 same interval as #20, higher pressure, loss (Cont.)

DESCRIPTION

0.0'-3.0' Dozed fill - no core.

3.0'-19.0' BASALT: Brown and green to dark gray, fine to medium-grained crystalline flow rock. Physical Condition: Moderately friable to moderately hard, massive with thin clay-chlorite lined fractures at 10.5 feet, 60 degrees and 75 degrees to core axis.

19.0'-43.5' BASALT FLOW BRECCIA: Light gray, medium-grained, crystalline basalt matrix. Zones of dark gray, fine to coarse-grained flow rock at 20'-23', 25'-28', and 35'-38'. Quartz lens at 26.5'. Calcite lens 60 degrees to core axis at 36.5'.

43.5'-45.0' BASALT: Brown to gray, microcrystalline with plagioclase phenocrysts. Physical Condition: Intensely fractured in angular, sharp ¼" to 1" fragments.

45.0'-57.5' BASALT PORPHYRY: Dark gray, microcrystalline, 1-2mm elongate white plagioclase phenocrysts in dark gray, hard, aphanitic groundmass. Physical Condition: Closely fractured with calcite veins in some fractures. 51.5'-52.5' Breccia gouge zone, green to brown-maroon clay matrix.

57.5'-61.5' BASALT: Medium - grained flow rock, irregular calcite lensing and impregnation. 61.0'-61.5' Breccia gouge zone, brown to maroon clay matrix.

61.5'-68.0' BASALT: Brown to gray, microcrystalline. Physical Condition: Intensely fractured in angular, sharp ¼" to 1" fragments. 64'-65' Breccia zone.

68.0'-73.0' BASALT: Fine to medium-grained flow rock, massive.

73.0'-85.0' BASALT FLOW BRECCIA: Grading in places to flow rock. Gray, medium-grained, crystalline, massive. 77.7'-79.9' Basalt porphyry, dark gray, aphanitic, 2-4mm white phenocrysts, ¼" to 4" fine to coarse-grained dark inclusions. Physical Condition: Moderate fracturing at 60°-70° to core axis, little weathering.

85.0'-91.7' BASALT PORPHYRY: Fine to medium-grained with 1mm light gray plagioclase phenocrysts. 88.2' broken zone with irregular fractures at 45 degrees and 60 degrees to core axis.

91.7'-95.0' BASALT PORPHYRY: Dark gray, aphanitic flow rock with 2-3mm white, tabular, plagioclase phenocrysts.

95.0'-103.5' BASALT PORPHYRY: Fine to medium-grained flow rock with 1mm light gray plagioclase phenocrysts. Dark inclusion at 103.5 feet. Physical Condition: Closely fractured, moderately weathered.

HOLE D-11 (continued)

COMMENTS

approximately 4.5 gpm, additional jacking.

Water Test #22 110'-130' Loss approximately 1 gpm, some jacking.

Water Test #23 same interval as #22, higher pressure, loss approximately 3.5 gpm, additional jacking.

Water Test #24 same interval as #23, higher pressure, loss approximately 4.5 gpm, significant additional jacking.

Water Test #25 110'-147' Loss approximately 2 gpm. Fractures slightly jacked.
Water Test #26 same interval as #25, higher pressure, loss approximately 9 gpm, some additional jacking.
Water Test #27 same interval as #26, higher pressure, loss approximately 9 gpm, continuous jacking.

DESCRIPTION

103.5'-108.0' BASALT PORPHYRY: Dark gray, aphanitic flow rock with 2.3mm white, tabular, plagioclase phenocrysts. Physical Condition: Moderate, incipient fractures, little weathering.

108.0'-131.0' BASALT: Coarse-grained, crystalline flow rock, massive. Physical Condition: Deeply weathered to green and maroon chlorite and clay minerals, low hardness, moderately to intensely fractured. Crushed from 125.0 feet to 130.0 feet.

131.0'-147.0' BASALT: Light gray, fine to medium-grained, crystalline, flow rock. Physical Condition: Closely fractured at 30 and 45 degrees to core axis. Little weathering.

146.7'-147.0' Breccia gouge zone, 1/8" to ¼" angular fragments in gray clay.

BOTTOM OF HOLE = 147.0 FEET

COMMENTS

Cored with 2 7/8" O.D. diamond bit.

Water Test #1 11.5'-23.4'.

Water Test #2 21.2'-33.1'. Similar loss in both tests, possible leak in fractures at 21.5'.

Water Test #3 31.3'-43.2'. No loss

Water Test #4 41.5'-53.4'. No loss

Water Test #5 51.5'-63.4'. No loss

Water Test #6 61.5'-73.4'. No loss

Water Test #7 71.5'-83.4'. Loss approximately 9 GPM.
Water Test # 7a 72.7'-84.6'. Loss approximately 13 GPM. Leakage probably in several fractures between 71.5' and 84.6'. Cemented hole to 84.6' and continued coring.
Water Test #8 82.1'-94.0'. No loss

DESCRIPTION

0.0'-43.4' BASALT PORPHYRY: Fine-grained to microcrystalline matrix, phenocrysts mainly pyroxene and plagioclase, dense, massive. Closely to little fractured; very thin clay coatings on some fractures; calcite coatings on most; hard; strong; deeply weathered to 22 feet, moderately weathered below 22 feet.

43.4'-111.3' BASALT FLOW BRECCIA: Fine-grained porphyritic basalt with slightly coarser-grained porphyritic inclusions; inclusions are angular to rounded, sand to cobble size with corroded and remelted boundarys, phenocrysts mainly pyroxene, olivene and plagioclase.

Closely to little fractured; no clay coatings; scattered calcite veinlets and vug fillings; moderately hard, weak to moderately strong; moderately to little weathered.

94.0'-96.0' Abundant calcite veins and calcite sealed fractures.

HOLE D-12 (continued)

COMMENTS

Water Test #9 92.1'-104.0'. Loss approximately 5 GPM, from fracture at 103.8'.

Water Test #10 101.3'-113.2'. Loss approximately 10 GPM. Probably loss from fractures at 103.8' and 108'.

Water Test #11 111.1'-123.0'. No loss

Water Test #12 same interval as #11, higher pressure, no loss.

Water Test #13 92.1'-123.0'. Retest of #9 and #10 intervals. Loss approximately 15 GPM.

Water Test #14 120.2'-132.1'. No loss
Water Test #15 100.2'-132.1'. Retest of 32' interval, Loss approximately 15 GPM.
Water Test #16 130.2'-142.1'. No loss
Water Test #17 130.2'-142.1' No loss, same interval higher pressure

Water Test #18 140.2 Terminated hole at 152.1 feet.

DESCRIPTION

43.4'-111.3' BASALT FLOW BRECCIA (cont.)

105.5'-106.6' Vesicular basalt, most vugs filled with calcite.

111.3'-142.0' BASALT PORPHYRY: Similar to above porphyry; phenocrysts finer grained, contacts are gradational top and bottom, no sharp boundaries. Closely to little fractured; calcite coatings on most fractures, probably tight in place; hard, strong, moderately weathered.

142'-152.1' BASALT FLOW BRECCIA: Same as above, little fractured, hard, strong, little weathered.

BOTTOM OF HOLE = 152.1 FEET

HOLE NO. D-12

COMMENTS	DESCRIPTION
Roller rock bit to 5.0' Set surface casing to 5.0 feet. Cored with 3¾" O.D. diamond bit. Lost circulation at 9.0 feet.	5.0'-51.6' BASALT FLOW BRECCIA: Basalt clasts 1/8" to 2" size in matrix of medium grained crystalline basalt. Closely to moderately fractured, minimum 0.1 foot, maximum 0.7 foot, moderately weathered.
	10.0'-12.0' Soft, disintigrated zone, intensely fractured.
Water Test #1 7.6'-14.5'. Loss about 4 GPM. Attempted Water Test #2 packer would not pass 10 feet, set casing to 15 feet	13.2'-51.6' Clasts of grey fine grained to medium grained basalt in dark gray, medium grained, massive, uniform crystalline basalt, many fractures cutting this interval are confined to the larger fine grained basalt clasts and to zones where rock grades to fine grained basalt. Closely to little fractured, minimum 0.1 foot, maximum 3.0 feet, most breaks slightly rough and clean, probably closed at depth; hard; little weathered.
Water Test #2 18.5'-25.4'. No loss	25.3'-26.0' Moderately soft zone, affected by partial granular disintigration.
No circulation loss while coring.	
Water Test #3 23.1'-35.0'. No loss	37.0'-38.0' Rock grades to fine grained light gray then back to medium grained, dark gray basalt.
Water Test #4 32.3'-44.2'. No loss	42.0'and 46.0' Olivene basalt porphyry flow rock inclusions in medium grained basalt, fairly sharp contacts, slightly resorbed.
Water Test #5 43.3'-55.2'. No loss	51.6'-70.2' OLIVENE BASALT PORPHYRY FLOW ROCK: Light gray with light reddish alteration streaks; fine-grained groundmass with abundant, evenly disseminated, 1 to 2 mm size weathered olivene phenocryats; laced with irregular closed chlorite filled fractures, more planar fractures lined with plates of shear polished chlorite. Closely fractured, mostly 0.1 foot to 0.5 foot, some intervals intensely fractured; hard, strong, little weathered.
Water Test #6 53.3'-65.2'. No loss	
Water Test #6a 63.1'-75.0'. No loss	70.2'-90.2' BASALT FLOW BRECCIA AND FLOW ROCK: Medium dark gray; massive with scattered inclusions of subangular to angular basalt clasts. Moderately fractured to massive; hard; strong.
Water Test #7 73.1'-85.0'. No loss	75.6'-76.1' Inclusions of gray basalt porphyry, slightly resorbed gradational contacts.
Water Test #8 78.3'-90.2'. No loss	
Terminated hole at 90.2 feet.	BOTTOM OF HOLE = 90.2 FEET

HOLE NO. D-14

HOLE LOCATION: Dam Right Abutment, Hill 1041 | HOLE ELEVATION: 1037 | ANGLE: Vert. | BEARING:
DRILL RIG: Cannon Drilling Co. Joy B-12 Rig | CORE SIZE: NX | LOGGED BY: RCH | DATE DRILLED: 11/4-8/68

COMMENTS	DESCRIPTION
Cored with 3¾ inch O.D. diamond bit. Set casing to 5.0 feet	0'-78.0' BASALT PORPHYRY FLOW ROCK: Massive, fine-grained rock with scattered phenocrysts of light green weathered olivene in a dense crystalline groundmass aggregate of plagioclase and dark minerals. Rock is brownish tan on surface of core, purplish gray-brown on freshly broken surfaces. Aspect of pitted surface mostly results from weathering out of olivene phenocrysts, core breaks on intersecting 45 degrees to 60 degrees dipping fractures. Generally moderately fractured to massive; moderately hard; deeply to moderately weathered.
Water Test #1 8.2'-15.1'. No Loss	0.0'-4.0' Core in ½ inch to 2 inches fragments, rounded by drilling action.
	4.0'-5.0' Closely fractured.
	5.0'-7.0' Closely to moderately fractured, intersecting 60 degrees dipping fractures with clay coatings and iron oxide stains.
Water Test #2 13.5'-25.4'. No loss	12.5'-15.5' Zone of close spaced, sheeted and intersecting fractures, clay and chlorite coated surfaces.
	20.5'-21.5' Irregular, rough surfaced fractures.
Water Test #3 23.1'-35.0'. No loss	
	40.0'-41.2' & 45.4'-47.5' Zone of irregular, closed, chlorite-filled fractures in gray basalt porphyry.
Driller reports mud on bit at 45.4 feet. Water Test #4 33.5'-45.4'. No loss	
Water Test #5 42.7'-54.6'. No.loss	61.5'-63.0' Interval of flow breccia, light gray basalt porphyry angular fragments in dark brown-gray medium grained basalt matrix.
Hole caved from undetermined depth after run to 60.4', 5' of cave retrieved in next run.	
Water Test #6 53.5'-65.4'. No loss	Most fracture breaks very narrow with only staining of Fe_2O_3 on surfaces.
Core blocking and grinding at 75 feet due to blocky nature of rock. Water Test #7 63.5'-75.4'. No loss	78.0'-102.7' BASALT FLOW BRECCIA: Reddish brown (dark brick red) color with varying concentrations of basalt clast inclusions, in a matrix of fine to medium-grained crystalline basalt. Rock is hard, cannot be scratched deeply with knife.
Water Test #8 73.2'-85.1'. Loss approximately 2 GPM, Core looks tight, drills smooth and fast, possible leak at 75' or contact?	Contact Zone Angular fragments of fine-grained gray basalt porphyry in matrix of reddish medium grained basalt, (78'-79'). Massive; hard.
Water Test #9 83.3'-95.2'. No loss	

HOLE LOCATION: Dam Right Abutment, Hill 1041 | HOLE ELEVATION: 1037 | ANGLE: Vert. | BEARING:
DRILL RIG: Cannon Drilling Co. Joy B-12 Rig | CORE SIZE: NX | LOGGED BY: RCH | DATE DRILLED: 11/4-8/68

COMMENTS	DESCRIPTION
	102.7'-108.7' BASALT PORPHYRY FLOW ROCK: Gray, massive, as in 0'-78' interval. Contact zone, fragments of gray basalt porphyry in reddish medium-grained basalt. Rock cut by many planar and irregular closed, chlorite-filled fractures.
Water Test #10 93.2'-105.1'. Loss 10-11 GPM, probably in fractures near contact, pressure buildup in formation with backsurge after releasing packer.	108.7'-129.0' BASALT FLOW BRECCIA: Reddish brown massive, medium-grained, with clasts of darker brown but generally similar basalt as inclusions, same as rock above 102.7 feet. Contact; gray basalt porphyry in direct contact with reddish medium-grained basalt. Contact surface irregular, but appears normal to core axis.
Water Test #11 103.1'-115.0'. Loss 2-3 GPM, probably from 115.0 feet.	
Water Test #12 113.5'-125.4'. Loss approximately 19 GPM, probably from several fractures, used 450 gallons of water coring this interval.	129.0'-134.4' BASALT PORPHYRY FLOW ROCK: As before. Contact; angular fragments of gray basalt porphyry in reddish medium-grained basalt.
Water Test #13 123.5'-135.4'. Loss approximately 3 GPM, from fractures near contact (?), used 600 gallons coring this interval.	134.4'-155.4' BASALT FLOW BRECCIA: Reddish brown, as before. Contact at drilling break, not recovered.
Water Test #14 133.4'-145.3'. Loss approximately 5-6 GPM, probably from fractures at 134' & 141'	
Water Test #15 143.5'-155.4'. No loss Terminated hole at 155.4 feet.	BOTTOM OF HOLE = 155.4 FEET

HOLE NO. D-15

COMMENTS	DEPTH / RECOVERY / CONDITION / LITHOLOGY	DESCRIPTION
Cored with 3½" O.D. diamond bit, set casing to 5.0 feet.		0'-13.0' **BASALT PORPHYRY BRECCIA:** Pale purple, fragments of porphyritic basalt in autobrecciated matrix; phenocrysts are mainly white plagioclase laths. Closely to moderately fractured; no clay fillings in fractures, oxide staining on some; hard; moderately strong; moderately weathered.
Water Test #1 8.1'-15.0'. Water loss 7-8 GPM many fractures.		13.0'-49.0' **BASALT FLOW BRECCIA:** Angular fragments in microcrystalline matrix; fragments are sand to cobble size, closely packed to scattered. Moderately fractured; no clay fillings; hard; strong; little weathered.
High drill water loss while coring.		
Water Test #2 13.1'-25.0'. Water loss 2-3 GPM numerous fractures.		
Water Test #3 23.1'-35.0'. No loss		37.0'-39.0' Thin shear fracture, slickensided gouge ½ to 1 inch thick, oriented about 3 degrees to core axis.
Water Test #4 32.5'-44.4'. No loss		49.0'-55.6' **SHEAR ZONE:** Slickensided gouge and fragmented basalt; most shear planes within zone are 30 degrees to 50 degrees to core axis, slickensides are variously oriented.
Water Test #5 42.5'-54.4'. No loss		55.6'-94.0' **BASALT FLOW BRECCIA:** Angular fragments of basalt in fine-grained crystalline matrix; fragments generally sand to gravel size and range from closely packed to scattered in matrix. Closely to little fractured; no clay fillings in fractures, slickensides on some; moderately hard; moderately strong; moderately weathered.
Water Test #6 52.3'-64.2'. No loss		
Water Test #7 62.7'-74.6'. No loss		
Erratic drilling rates, slow to fast.		
Water Test #8 72.5'-84.4'. No loss		
600 gallons of water used in coring 64 to 93 feet.		
Water Test #9 82.0'-93.9'. No loss		94.0'-134.1' **INTERBEDDED BASALT and TUFF BRECCIA:** Porphyritic basalt with phenocrysts of olivene and pyroxene (?) altered to chlorite in dense microcrystalline matrix; tuff breccia consists of various textured basalt clasts, gravel to cobble size, angular; in fine-grained tuff matrix.

COMMENTS

DESCRIPTION

0.0-60.0 BASALT FLOW BRECCIA; angular to sub-angular fragments of BASALT and olivine BASALT in a matrix of fine-grained BASALT. Matrix is generally darker, finer-grained, and less altered than the breccia fragments. Rock is purplish brown to gray on fresh surfaces, tan to greenish brown where weathered. Moderately to closely fractured; fractures dip 30° or less, and nearly vertical. Moderately hard and strong, moderately to severely weathered.

(0.0-4.0) Massive BASALT flow unit, purplish gray, moderately hard and strong, fracture spacing 0.1 to 0.6 foot, crush zone at 2.1-2.5 feet.
(4.0-37.5) BASALT flow breccia, mottled green and purplish brown. Moderately hard and strong, moderately weathered (locally severely weathered). Fracture spacing 0.1 to 1.2 feet, averages 0.3 foot. Most fractures have patchy oxide coatings; a few have mud-like fillings to 1/16 inch thick.
(7.0-7.1) Crush zone
(13.2-13.5) Crush zone.
(26.3) Calcite vein 1/8-inch thick.
(37.5-60.0) BASALT flow breccia, purplish gray and greenish gray. Moderately hard and strong, moderately weathered. Fracture spacing 0.1 to 2.0 feet; average fracture spacing 0.5 foot. Fractures generally uncoated; a few have patchy oxide coatings.
(46.0-47.2) Altered zone, brown, weak.

(55.2) Thin crush zone, nearly horizontal.

BOTTOM OF HOLE = 60.0 FEET

NOTES: 1. Collar is about 2 feet below original ground.
2. Average rock hardness 3.5-4.5 on Mho's scale, 1-28-70.
3. Water level 35.9 feet.
4. Fluid take during drilling was very low--250 gallons used for entire hole.

BOX 1 of 4: 0.0-17.6
2 of 4: 17.6-36.1
3 of 4: 36.1-55.3
4 of 4: 55.3-60.0

HOLE NO. D-17

HOLE LOCATION BORROW AREA 1 | HOLE ELEVATION 1222' (TOPO) | ANGLE 90° | BEARING

DRILL RIG JOY 12B--Fred Cannon Co. | CORE SIZE Nx | LOGGED BY RET | DATE DRILLED 1/22-26/70

COMMENTS

DESCRIPTION

0.0-15.1 BASALT; hard, fresh, fine-grained BASALT with about 1% scattered, altered olivine phenocrysts up to 1/8-inch diameter. Rock is blue-gray on cored surface, black on freshly broken surface. Fracture spacing 0.1 foot to 0.6 foot, averages 0.4 foot. Most fractures have extensive oxide and mud-like coatings; a few have crushed rock fillings up to 1/10-inch thick. Fractures dip 0°-20°, 45°, and nearly vertically in core. Slickensides present on some fracture coatings. Massive--no flow structure apparent.

(10.0) specific gravity = 2.61

15.1-70.0 BASALT FLOW BRECCIA; angular to sub-angular fragments of BASALT and olivine BASALT in a matrix of fine- to medium-grained BASALT. Matrix material (about 60% of total volume) is purplish gray, medium hard, and moderately weathered. Breccia fragments are fine to coarse grained, gray and greenish-gray, basaltic rock, medium hard and moderately weathered, but locally are altered and distinctly weaker then the matrix.

Fractures dip at 0°-20° and 45°-60°; a few are nearly vertical. Fractures pass through matrix and included fragments directly; no preference shown towards breaking around inclusions. Fracture spacing 0.1 to 1.9 feet, average spacing about 0.8 foot.
(15.1-19.1) Most fractures have thin sand, clay, or oxide coatings.
(19.1-49.0) Fractures clean or have patchy mud or caliche coatings.
(19.5-19.8) Crush zone, dips 60°.
(36.8-37.2) Crush zone.
(37.5) 1/4" Calcite vein.
(41.5-41.9) Crush zone.

(49.0-70.0) Fractures generally clean; some have thin clay coatings or fillings to 1/10-inch thick, and show slickensides.
(58.5) Trace of iron sulfice (Pyrite?)
(58.7) Flow structure, dips 30°.
(63.0) Thin crush zone.
(65.4-65.8) Alteration and crush zone.
(59.0) Specific gravity =2.35

BOTTOM OF HOLE - 70.0 FEET

NOTES: 1. Hole caved at 2 feet, 1/28/70.
2. Collar is approximately 8 feet below original ground.
3. Average rock hardness 3.5-4.5 on Mho's scale.
4. Rock is of light heft throughout.
5. 500 gallons of drilling water used for entire hole.
6. Boundaries between FLOW BRECCIA units are indistinct, but individual flows appear to range from 5 to 25 feet thick.

BOX 1 of 4: 0.0-19.1
2 of 4: 19.1-37.4
3 of 4: 37.4-54.4
4 of 4: 54.4-70.0

COMMENTS

DESCRIPTION

0.0-50.0 BASALT FLOW BRECCIA; angular to subangular fragments of BASALT and ANDESITE in a matrix of fine-grained BASALT. Matrix material is about 2/3 of total volume. Included fragments vary in size from 1/4-inch to about 1 foot in diameter apparent in the core. Bedding or flow structure lacking.

(0.0-13.6) Tan, moderately to severely weathered, many inclusions altered, core has a pock-marked appearance due to voids where olivine crystals have weathered away. Fracture spacing 0.1 to 0.6 foot, fractures have mud and oxide coatings. 1/2-inch crush zone at 4 feet. Closely fractured at about 13 feet.
(13.6-50.0) Blue-gray matrix with greenish inclusions. Moderately weathered, moderately hard and strong. Fracture spacing 0.1 to 3.0 feet, average 0.8 foot. Most fractures are clean; some have patch clay and/or oxide coatings. Most fractures are either nearly horizontal or nearly vertical.
(34.8-50.0) Rock appears to be slightly altered, but is moderately hard and strong.
(35.8) 2" alteration and crush zone.
(38.6) 1" crush zone, horizontal.
(40.2) 1" crush zone, horizontal.
(49.0) Thin shear zone, dips 45°.

NOTES: 1. Fluid level 1/31/70: 27.5 feet.
2. Hole took about 500 gallons of water per day. Most of the water seemed to go into fractures at 13 feet and 35 feet.
3. Collar is approximately 1 foot below original ground.

BOTTOM OF HOLE = 50.0 FEET

HOLE NO. D-19

NOTES

1. Notes 1,2 and 3 of drawings number 8 apply to this drawing.

COMMENTS | DEPTH | RECOVERY | LOG | DESCRIPTION

0.0-80.0 BASALT FLOW AND FLOW BRECCIA; fine to coarse-grained with about 5% scattered, olivine crystals to 1/8-inch diameter. The olivine is altered throughout the hole, and locally was washed away by the drilling. The matrix of the flow breccia is as described above; about 2/3 of the flow breccia is angular to sub-rounded fragments of basaltic rock up to 1 foot long in the core. Fractures throughout dip nearly horizontally, nearly vertically, and at 25°-30° (parallel to bedding or flow structure). Individual flow units are about 2 to 15 ft. thick; boundaries are vague.

(0.0-2.0?) BASALT FLOW (?), severely weathered, weak to moderately hard, maximum core length recovered 0.3 ft.
(2.0(?)-6.4) SANDSTONE, fine to medium-grained, thin-bedded, weak, bedding chips 25°. Fracture spacing 0.2 ft., fractures coated with oxides.
(6.4-16.0) BASALT FLOW ROCK, highly altered, greenish-gray, weak to moderately hard and strong. Fracture spacing 0.1 to 0.4 ft., averages 0.2 ft. Fractures coated with clay or alteration products.
(16.0-21.0) BASALT FLOW ROCK, moderately weathered, moderately hard and strong, locally altered and weak. 1/2-inch chalcedony vein @ 16.5-18.5.
(21.0-47.0) BASALT FLOW BRECCIA, generally slightly to moderately weathered.

(21.0-47.0) BASALT FLOW BRECCIA--Cont., moderately hard and strong. Fracture spacing 0.1 to 2.3 ft., averages 0.5 ft. Most fractures have patch clay or oxide coatings.
(47.0-65.5) BASALT FLOW ROCK, slightly to moderately weathered, moderately hard and strong, gray to reddish gray. Fracture spacing 0.2 to 2.3 ft., averages 1 foot. Fractures clean or have patchy clay coatings. Contains a few scattered inclusions.
(65.5-80.0) BASALT FLOW BRECCIA, slightly to moderately weathered, moderately hard and strong. Fracture spacing 0.1 to 2.3 ft., averages 0.8 ft. Most fractures have patchy clay coatings.

BOTTOM OF HOLE = 80.0 FEET

NOTES: 1. Fluid level 2/2/70: 13.8 feet.
2. Elevations are unsurveyed.
3. Fluid take was low during drilling.
4. Collar is approximately 3 feet below original ground.

COMMENTS | DEPTH | RECOVERY | LOG | DESCRIPTION

0-2.0 SOIL; Silty SAND

2.0-55.0 BASALT FLOW BRECCIA; Angular to sub-rounded fragments of BASALT and ANDESITE in a matrix of fine-to coarse-grained BASALT. Included fragments (1/16-inch to 1 foot diameter) make up about 75% of the rock; the matrix is about 25% of the rock, color greenish to purplish gray. Moderately to closely fractured, fractures dip 30° and nearly horizontal.

(2.0-16.0) BASALT FLOW BRECCIA, severely to moderately weathered, weak to moderately hard and strong. Fracture spacing 0.05 to 0.8ft. Fractures generally have thin or clay fillings. May include some sedimentary breccia.
(16.0-55.0) BASALT FLOW BRECCIA, moderately to slightly weathered, moderately hard and strong. Fracture spacing 0.1 to 2.5 ft., averages about 1 ft. Fracture surfaces clean or have thin to patchy clay coatings.

Comments: Cemented interval 20.0-23.0 to stop water loss at 22.6 ft.

BOTTOM OF HOLE = 55.0 FEET

NOTES: 1. Water level 2/10/70: 7 feet.
2. Collar and original ground elevations are the same.

HOLE NO. D-21

HOLE NO. D-22

COMMENTS | DEPTH | RECOVERY | LOG | DESCRIPTION

0.0-27.8 BASALT FLOW ROCK; generally fine-grained with about 2% disseminated phenocrysts of altered olivine. Moderately hard and strong, to hard and locally brittle. Fracture spacing 0.6 to 0.05 ft., averages 0.3ft. Fractures dip 15°, 60°, and nearly vertical. Fractures have clay or oxide coatings, many show slickensides. Flow structure vague, apparently parallels fractures dipping @ 15°.

(0.0-5.0) Moderately weathered, medium-grained.
(5.0-27.8) Moderately to slightly weathered; hard and strong.

27.8-39.5 BASALT FLOW BRECCIA; angular to sub-rounded fragments of BASALT and olivine BASALT in a matrix of fine-to medium-grained BASALT. Green where altered, dark gray where fresh or moderately weathered. Fracture spacing 0.3 to 1.0 ft., averages about 0.6 ft. Most fractures have patchy to extensive thin clay coatings which show slickensides.

39.5-45.0 BASALT FLOW ROCK; Similar to interval 0.0-27.8. Severely to moderately weathered, moderately hard and strong. Fracture spacing 0.05 to 0.5 ft. Fractures dip 25° and 70-90°. Most fractures have clay fillings up to 1/10-inch thick and show oblique-slip slickensides.

BOTTOM OF HOLE = 45.0 FEET
NOTES: 1. Water level 2/11/70: 5 feet
2. original ground elevation 1130 (TOPO)

NOTES

1. The subsurface information shown in the trench logs presented on this drawing indicate conditions found only at the date and location of the trench. Users of this information are cautioned that the Engineer and W.A. Wahler and Associates in no way warrant that such information is representative of conditions at any other location, or at any other time. Strata, lithology and other conditions may change between trenches due to lensing or discontinuity of formation or due to dipping of strata or other causes. Groundwater levels are subject to change with time, depending on precipatation and subsurface runoff, etc.
2. The subsurface exploration program was carried out to provide a basis for the design of the works presented in these plans. Reasonable continuity between points of known data was assumed for design purposes. If conditions differing substantially from those shown are encountered, the Engineer shall be notified to permit modified recommendations and/or design to be made.
3. Additional trenches, other than those shown on Trench Location Map, have been excavated in the vicinity. These additional trenches were outside the limits of Borrow Area F, and are therefore not shown. Only the logs of trenches shown on the Trench Location Map are included in these plans.
4. Soil classifications shown on logs are field classifications based on Unified Soils Classification System.
5. Where soil is gradational between clay, silt, sand, and/or gravel, log representation has been patterned with symbol for predominant soil type.
6. See Drawing number 16 for key to soil classification patterning in the trench logs.
7. Trenches were made in November 1968.

NOTES

1. Manhole steps shall be 3/4" galv. steel embedded in manhole wall. Alhambra Fdy. A 3315 or equal.
2. 20" I.D. steel pipe manhole shall conform to applicable sections of AWWA Standards C 207 and C 208.
3. Mortar lining shall be refinished in the field to provide 3/4" minimum cover for all exposed steel inside surfaces.
4. All exposed steel surfaces shall be painted with coal tar enamel in conformance with AWWA Std C 203 for above ground conditions; Section 5.

AS CONSTRUCTED
DATE 4/24/73 DFT [illegible] CKD DFM

LIST OF MATERIALS

ITEM NO.	DESCRIPTION
1	27 1/2" O.D. x 1 1/8" steel plate with 3/4" φ rod handles - use washers and galvanize.
2	1/16" cloth inserted rubber sheet packing gasket. (Fed. Spec. H-H-P-151).
3	27 1/2" O.D. AWWA C 207-55 Class D steel hub flange.
4	20" I.D. x 5/16" wall steel pipe with 3/4" mortar lining.
5	12" x 5/16" steel collar welded to pipe.
6	38" I.D. x 5/16" wall steel pipe with 3/4" mortar lining.
7	Concrete encasement.

3/8" = 1'-0"
1" = 1'-0"

NOTES

1. ZONE "A" EXCAVATION: The overbreak beyond excavation lines shall not exceed 4" and inward projection from excavation lines shall not exceed 3". The area projecting inward shall not exceed 5% of the total area.
2. ZONE "B" EXCAVATION: The overbreak beyond excavation lines shall not exceed 9" and inward projection from excavation lines shall not exceed 6". The area projecting inward shall not exceed 10% of the total area.
3. Backfill material shall be compacted to not less than 95% density as determined by ASTM-D1557-66T test.
4. Grouting shall be started not less than 7 days after the Class "C" Concrete Backfill is completed.
5. Second stage concrete, as shown in Detail (A/28) shall be placed not less than 7 days after placement of first stage concrete.

GENERAL NOTES

1. All concrete shall be Class "A" (3000 psi @ 28 days) unless otherwise shown.
2. Class A concrete shall have a minimum of 6 sacks of cement for each cubic yard of mix.
3. Foundation concrete shall be placed only on firm, undisturbed rock, approved by District's representative.
4. Before placing concrete, verify requirements of sleeves, openings, utilities, embedded parts, etc.
5. All construction joint surfaces shall be sand blasted as to leave a clean roughened surface of sound concrete. Immediately prior to placing the next concrete lift, 1/2" of 1:2 mortar shall be placed on the cleaned surface of the previous lift.
6. Chamfer all exposed corners 3/4" unless otherwise shown.
7. Reinforcement shall conform to the latest ASTM designation A-615, Grade 40.
8. Minimum bar lap at splices and minimum projection of dowels, shall be 24 diameters of smaller bar, unless otherwise shown.
9. Class A and Class C concrete for intake-outlet conduit shall have San Gabriel Valley aggregates. For all other structures, concrete shall have aggregates treated by "heavy media" process and used from State approved stockpiles.
10. Before placement of concrete, the foundation surfaces shall be thoroughly cleaned by hand sweeping and high pressure air and/or water jets. Immediately prior to placing concrete, the surface of the foundation shall be free of standing water and loose material.
11. Class C concrete shall have a minimum 2000 psi ultimate strength at 28 days and shall have not less than 4 sacks of cement per cubic yard of concrete.
