Las Virgenes Municipal Water District
Water System Design Report
for
Amended Vesting Tentative Tract No. 53138
Deerlake Ranch
Los Angeles County, California

Section 1 - Introduction

Amended Vesting Tentative Tract No. 53138 is located on approximately 232.87 acres in the hills northeast of the Topanga Canyon Blvd. interchange with California Highway 118 (Simi Valley Freeway) in Los Angeles County, California. The development includes 314 single-family residential lots, one recreation building, one sheriff facility, and 31 open space/slope lots.

The purpose of this Water System Design Report (WSDR) is to investigate the feasibility of providing potable water service to Amended Vesting Tentative Tract No. 53138, and to develop criteria for the facilities required to provide adequate service. Potable water demand for the proposed development is based on the HDR Technical Memorandum Water Demand Estimate Study, May 2 2017. Fire protection requirements are as determined by the Los Angeles County Fire Department.

The owner and developer of Amended Vesting Tentative Tract No. 53138 is Forestar Chatsworth, LLC, 4590 MacArthur Blvd., Suite 600, Newport Beach, California 92660, (949) 748-6714. The developer's engineer is United Civil Inc., 30141 Agoura Road, Suite 215, Agoura Hills, California 91301, (818) 707-8648.

The Preliminary WSDR for Amended Vesting Tentative Tract No. 53138 was completed by Boyle Engineering Corporation on April 24, 2001. The report has since undergone five revisions, which were completed in January 2002, July 2003, March 2004, and December 2014 and August 2017 (Reference 2). Revision 5 included the Kennedy Jenks Consultants Storage and Pumping Capacity Study dated July 16, 2016 and the HDR Technical Memorandum Water Demand Estimate Study dated May 2, 2017.

Section 2 - Proposed Development

Amended Vesting Tentative Tract No. 53138, shown on **Plate 1**, comprises approximately 232.87 acres, in an unincorporated area of Los Angeles County, northeast of the Topanga Canyon Boulevard Interchange with California State Highway 118. Access to the proposed development will be from Topanga Canyon Boulevard on the west and from Canoga Avenue on the south.

The proposed development is zoned R-1-6000 (Low Density Urban Residential) and A-1-1 (Non-urban Residential), and includes 314 single-family residential lots, one recreation building, one sheriff facility, and 31 open space/slope lots. The grading quantity is 1,874,600 CY which will be balanced on site. According to the developer's tentative tract map (**Appendix A**), ground elevations within the proposed development range from approximately 1,160 feet at the horse trail in the southeast corner, to 1,485.1 at the end of Wurster Way on the north edge of the tract. Proposed building pad elevations range from 1,261.5 feet on Poema Place (lot 18), east of the bridge, to 1,485.1 feet at lot 174 on Wurster Way.

Section 3 - Potable Water Demand

The potable water demand estimated for the proposed development is shown in **Tables 1, 2, and 3**. Each table represents a different phase of the project. Demand will be generated by residential use and landscape irrigation. The demands are based on the HDR Technical Memorandum dated May 2, 2017; (**Appendix D)** The Los Angeles County Fire Department requires that a 1,250 gpm fire flow be available to serve the residential units, with a residual pressure of 20-psi maintained for two hours at the flowing fire hydrants. The recreation building and sheriff facility requires a 1,500 gpm fire flow at 20 psi for a duration of 2 hrs. Pipeline sizes were determined by analyzing maximum day demand with concurrent fire flow, and peak hour demand. However, The Church at Rocky Peak is the largest structure within the subsystem with a required fire flow of 3,750 gpm for three (3) hrs.

TABLE 1

Phase 1 Estimated Potable Water Demand for Amended Vesting Tentative Tract No. 53138

				Estimated Water Demand (gpm)		
Hydraulic Gradient Zone	**Land Use**	**No. of Units or Acres**	**Demand Criteria**	**Avg. Day Demand**	**Max. Day Demand**	**Peak Hour Demand**
1585	Interior Residential	103 Units	240 gpd/unit (1)	17.5	64.8	87.6
1585	Level Landscaped Private Areas	7.83	5 acre-ft./acre/year (2) (3.08 gpm/acre)	24.3	89.8	121.3
1585	Sloped Private Areas	16.58	1.3 acre-ft./acre/year(3) (.80 gpm/acre)	13.4	49.4	66.8
1585	Common Landscaped Areas	20.65	2.5 acre-ft./acre/year(4) (1.55 gpm/acre)	32.0	118.4	160.0
1585	Sheriff Station	0.44	3 acre-ft./acre/year (5) (1.85 gpm/acre)	0.82	2.63	4.1
1585	Rec Center	1.96	3 acre-ft./acre/year(5) (1.85 gpm/acre)	3.64	11.7	18.2
			Total Demand	**91.6**	**336.8**	**458.00**

MDD factor - 3.7 & PHD factor = 5.0 from HDR report

(1) Interior demand criteria from HDR report 80 gpcd * 3 persons per unit.

(2) Level landscaped private areas = 3,310.61 sf per lot, from HDR table 7 entry divided by 314 units

(3) Sloped private areas = 7,011.69 sf per lot, from HDR table 7 entry divided by 314 units

(4) Common area = 44.7 ac from HDR report prorated to phase I & II based on 2/9/2016 WSDR

(5) Sheriff & Rec center from 2/9/2016 WSDR

TABLE 2

Phases 1 & 2 Estimated Potable Water Demand for Amended Vesting Tentative Tract No. 53138

				Estimated Water Demand (gpm)		
Hydraulic Gradient Zone	**Land Use**	**No. of Units or Acres**	**Demand Criteria**	**Avg. Day Demand**	**Max. Day Demand**	**Peak Hour Demand**
1585	Interior Residential	245 Units	240 gpd/unit (1)	41.7	64.8	208.3
1585	Level Landscaped Private Areas	18.62	5 acre-ft./acre/year (2) (3.08 gpm/acre)	57.7	89.8	288.6
1585	Sloped Private Areas	39.44	1.3 acre-ft./acre/year(3) (0.80 gpm/acre)	31.8	49.4	158.9

Section 4 - Existing Potable Water System

Amended Vesting Tentative Tract No. 53138 will be served from the District's 1,585-foot gradient Twin Lakes Subsystem. At present, the 1,585-foot Twin Lakes Subsystem is isolated from the rest of the District. The Subsystem is supplied by Twin Lakes Pump Station via Metropolitan Water District's West Valley Feeder No. 2 at the LV-3 Turnout with an emergency connection to Los Angeles Department of Water and Power. The tanks have a combined capacity of 2.0 MG. The pump station is designed to be operated 18-hours, for 24-hour period per the LVWMD Potable Water Master Plan Update 2014.

The pump station maintains the gradient in the Twin Lakes Tanks (HWL=1,585 feet). This source was represented in the hydraulic model as a reservoir with an HGL of 1,580 feet at the intersection of Topanga Canyon Boulevard and Poema Place in the LVMWD Potable Water Mater Plan. This HGL accounts for the head loss in the pipelines from the storage tanks to the intersection of Topanga Canyon Boulevard and Poema Place as simulated in the LVMWD's 2014 Master Plan model. The Upper Twin Lakes subsystem was not used as a source because it has a nominal capacity of only 400 gpm which would not be enough to satisfy Deerlake Ranch's maximum day demand of 892.6 gpm.

The pump station currently has a nominal capacity of 2,500 gpm. Duty pumps include two 430 gpm, one 585 gpm, two 225 gpm pumps and one standby 585 gpm pump. The existing maximum day demand for the Twin Lakes system is 1,200 gpm, with Upper Twin Lakes drawing an additional 400 gpm, yielding a total maximum day demand of 1,600 gpm.

The total projected demand within the Twin Lakes Subsystem after the development of Amended Vesting Tentative Tract No. 53138 is shown in **Tables 4, 5, and 6** depending on the construction phase.

TABLE 4

Required Tank and Pump Station Capacities For Twin Lakes Subsystem with Proposed Development (Phase 1)

Projected Demands:		**Maximum Day Demand (MDD)**
Existing Twin Lakes Subsystem:		1,200 gpm
Projected Infill Demand		13
Projected Tract 53138 Demand:		337 gpm
Total Projected Demand:		**=1,550 gpm**
Pumping Capacity:		**Capacity**
MDD (pumping required)	= (MDD*(24 hr. /18 hr.))[6]	= 2,061 gpm
Upper Twin Lakes Requirement	= (MDD*(24 hr. /18 hr.))[6]	= 532 gpm
Total Pumping Capacity		= **2,593 gpm**
Existing Pumping Capacity	=2,593 gpm (24 hr/18 hr.)	= **2,500 gpm**
Required Pumping Capacity		**= 93 gpm**
Tank Capacity:		**Capacity**
Daily Regulation Storage		= 929,880 gallons
Fire Storage	= (MDD*(600 min))	= 675,000 gallons
Emergency Storage	= (3750gpm*3 hrs.*60/min/hr.)[7]	= 464,940 gallons
Total Required Storage	= (MDD*(5 hr.)(60 min/hr.)) [6]	**= 2,069,820 gallons**
Existing Storage		**= 2,000,000 gallons**
Required Storage		**= 69,820 gallons**

Notes:

(6) Upper Twin Lakes MDD = 400 gpm from HDR Technical Memorandum, pumping is based on 18 hrs which yields a pumping rate of 532 gpm.

(7) Fire flow of 3,750 gpm for 3 hrs. is required in the subsystem for the Church at Rocky Peak

TABLE 5

Required Tank and Pump Station Capacities For Twin Lakes Subsystem with Proposed Development (Phases 1 & 2)

Projected Demands:		**Maximum Day Demand (MDD)**
Existing Twin Lakes Subsystem:		1,200 gpm
Projected Infill Demand		13
Projected Tract 53138 Demand:		666 gpm
Total Projected Demand:		**=1,879 gpm**
Pumping Capacity:		**Capacity**
MDD (pumping required)	= (MDD*(24 hr. /18 hr.))[6]	= 2,499 gpm
Upper Twin Lakes Requirement	= (MDD*(24 hr. /18 hr.))[6]	= 532 gpm
Total Pumping Capacity		= **3,031 gpm**
Existing Pumping Capacity		= **2,500 gpm**
Required Pumping Capacity		**= 531 gpm**
		Capacity
Tank Capacity:		
Daily Regulation Storage		= 1,127,520 gallons
Fire Storage		= 675,000 gallons
Emergency Storage	= (3750gpm*3 hrs.*60/min/hr.)[7]	= 563,760 gallons
Total Required Storage	= (MDD*(5 hr.)(60 min/hr.)) [6]	**= 2,366,280 gallons**
Existing Storage		**= 2,000,000 gallons**
Required Storage		**= 366,280 gallons**

NOTE:

(6) Upper Twin Lakes MDD = 400 gpm from HDR Technical Memorandum, pumping is based on 18 hrs.

(7) Fire flow of 3,750 gpm for 3 hrs. is required in the subsystem for the Church at Rocky Peak

TABLE 6

Required Tank and Pump Station Capacities For Twin Lakes Subsystem with Proposed Development (Phases 1, 2, & 3)

Projected Demands:		**Maximum Day Demand (MDD)**
Existing Twin Lakes Subsystem:		1,200 gpm
Projected Infill Demand		13
Projected Tract 53138 Demand:		893 gpm
Total Projected Demand:		**=2,106 gpm**
Pumping Capacity Calculations:		**Capacity**
MDD (pumping required)	= (MDD*(24 hr. /18 hr.)) [6]	= 2,800 gpm
Upper Twin Lakes Requirement	= (MDD*(24 hr. /18 hr.))[6]	= 532 gpm
Total Pumping Capacity		**=3,332 gpm**
Existing Pumping Capacity	=3,332 gpm (24 hr. /18 hr.)	**=2500 gpm**
Required Pumping Capacity		**= 832 gpm**
		Capacity
Tank Capacity Calculations:	=MDD (600 min)	
Daily Regulation Storage		= 1,263,360 gallons
Fire Storage		= 675,000 gallons
Emergency Storage	= ((3750gpm*3 hrs.*60/min/hr.)) [7]	= 631,680 gallons
Total Required Storage	=MDD (5 hr.)(60 min/hr.) [6]	**= 2,570,040 gallons**
Existing Storage		**= 2,000,000 gallons**
Required Storage		**= 570,040 gallons**

Notes:

(6) Upper Twin Lakes MDD = 400 gpm from HDR Technical Memoradum, pumping is based on 18 hrs

(7) Fire flow of 3,750 gpm for 3 hrs. is required in the subsystem for the Church at Rocky Peak

Demand generated by Tract No. 53138 exceeds current pumping and storage capacity in the Twin Lakes zone for all proposed construction phases. In **Table 4**, which details pumping and storage capacity calculations for Phase 1, the recommended pumping capacity is 93 gpm over the 2,500 gpm available and the recommended storage capacity is 0.346 million gallons (MG) over the 2.0 MG available. **Table 5** contains the pumping and storage capacity calculations for Phases 1 and 2, the recommended additional pumping capacity is 531 gpm over the existing 2,500 gpm available and the recommended additional storage capacity is 0.366 MG over the 2.0 MG available. Finally, in **Table 6**, are the pumping and storage capacity calculations for Phases 1, 2, and 3, the recommended pumping capacity is 832 gpm over the 2,500 gpm available and the recommended storage capacity is 0.570 MG over the 2.0 MG available.

Phase 1 does not require any changes due to the negligible impact in the subsystem. However, to provide the capacity needed in Phase 2, a seventh pump having a capacity of approximately 500 gpm is required. This would increase the capacity of Twin Lakes Pump Station to 3,000 gpm with all pumps running. To maintain a stand-by pump unit, an eighth pump having a capacity of approximately 500-600 gpm is recommended. Phase 3 requires the addition of a ninth pump with a capacity of approximately 400 gpm for a total pumping capacity of 3,400 gpm at the Twin Lakes Pump Station. Additional storage of 0.36 MG is required for Phase 2 and 0.21 MG for Phase 3. It is not practical to build storage in these increments so 0.6 MG of storage should be provided in Phase 2.

An existing 8-inch suction line transmits water from the LV-3 turnout to the Twin Lakes Pump Station. Modifications to the existing turnout were not analyzed in this report. Additionally, physical modifications to the Twin Lakes Pump Station and Tanks were not analyzed in this report.

Section 5 - Proposed Potable Water System

The proposed potable water system necessary to serve Amended Vesting Tentative Tract No. 53138 is shown on **Plates 2, 3, and 4,** depending on the phase of the project. Different distribution pipeline sizes and configurations were sized ranging from 8 to 16 inches in diameter based on the grading plans provided by the Developer showing finished pad elevations ranging from 1261 feet to 1485 feet. The adequacy of the proposed distribution system to serve Deerlake Ranch was analyzed under maximum day demand plus concurrent fire flow.

The maximum day demand of 893 gpm for Phases 1, 2, and 3 was analyzed concurrently with fire flows. The required fire flow of 1,250 gpm for residential, was analyzed at all fire hydrants within the distribution system. The recreation building and sheriff facility, which had a fire flow of 1,500 gpm was not used in the analysis, however the proposed water main to the recreation bldg. will be a 10-inch pipeline and is capable of providing the 1500 gpm fire flow. It was assumed that there will be only one fire at a time within the development. The analysis shows that all fire hydrants will be able to supply the required fire flows while maintaining residual pressures above 20 psi as required by Los Angeles County Fire Department fire flow requirements.

The peak hour demand of 1,209.2 gpm for all three phases of development was analyzed. The peak hour demand pressure distribution shows that the pressures would be approximately 35 psi at the higher elevations of 1,480 feet up to approximately 140 psi at lower elevations of 1,240 feet all of which meet the 35 psi minimum pressure and 150-psi maximum criteria of LVMWD. However, some locations along the southern part of Canoga Avenue such as open space lot 322 have pressures up to approximately 170 psi which should not present significant problems since these are landscape areas. Locations with elevations below approximately 1370 feet will have pressures in excess of the maximum 80-psi required by the Uniform Plumbing Code and therefore would require pressure regulators. All pipelines have been adequately sized with pipeline velocities below the maximum 5 fps as required by LVMWD’s design criteria.

The final water distribution system configuration that satisfied LVMWD’s design criteria for Phase 1 of development is described as follows:

- The water main between the Twin Lakes tanks and the intersection of Topanga Canyon Boulevard and Poema Place should be 16-inches in diameter.

- The water main along Poema Place from Topanga Canyon Boulevard to Bulfinch Road should be 16 inches in diameter.

- The water main from the intersection of Poema Place and Bullfinch Road, along Poema Place to the intersection of Poema Place and Canoga Avenue should be 10 inches in diameter.

- The water main from the intersection of Poema Place and Bullfinch Road, along Bullfinch Road to the intersection of Bullfinch Road and Nogan Drive should be 10 inches in diameter.

- The water main from the intersection of Bullfinch Road and Nogan Drive, along Nogan Drive and Canoga Ave to the intersection of Poema Place and Canoga Avenue should be 10 inches in diameter.

- The water main from the intersection of Poema Place and Canoga Avenue, going south along Canoga Avenue should be 6 inches in diameter since it will be tied into the existing system and will mainly be used for landscape irrigation.

- The remaining mainline pipelines should be 8-inches and should be reduced to 4-inch to 6-inch after the last fire hydrant terminating in cul-de-sacs.

The final water distribution system configuration that satisfied LVMWD's design criteria for Phase 2 and 3 of development is described as follows:

- The water main from the intersection of Nogan Drive and Canoga Avenue, along Canoga Avenue and Bullfinch Road to the intersection of Bullfinch Road and Nogan Drive should be 10 inches in diameter.

- The remaining pipelines including those terminating in cul-de-sacs should be 8-inches and should be reduced to 4-inch to 6-inch in diameter after the last fire hydrant terminating in cul-de-sacs.

- The water main from the intersection of Bullfinch Road and Schindler Way, along Schindler Way and Sullivan Way to the intersection of Sullivan Way and Bullfinch Road should be 10 inches in diameter.

- The remaining pipelines including those terminating in cul-de-sacs should be 8-inches and should be reduced to 4-inch to 6-inch in diameter after the last fire hydrant due to residential and landscaping demands.

The Los Angeles County Fire Department has determined that the development will require 37 new fire hydrants, located throughout the development (**Appendix B**). These hydrants shall conform to AWWA Standard C503 with 6”x 4"x 2-1/2" bronze heads. The minimum flow required is 1250 gpm for 2 hours at all locations except the recreation building, which requires 1500 gpm for 2 hours. The proposed system will be capable of providing fire flow to all hydrants at pressures greater than the current required minimum residual pressure of 20 psi.

In order to serve the proposed development for all three phases, the water main between the Twin Lakes tanks and the intersection of Topanga Canyon Boulevard and Poema Place should be 16-inches in diameter. Phase 1 does not require any additional pumping or storage because the changes have negligible impact in the subsystem. However, to provide the capacity needed in Phase 2, a seventh pump having a capacity of approximately 500 gpm is required. This would increase the capacity of Twin Lakes Pump Station to 3,000 gpm with all pumps running. To maintain a stand-by pump unit, an eighth pump having a capacity of approximately 500-600 gpm is recommended. Phase 3 requires the addition of a ninth pump with a capacity of approximately 400 gpm for a total pumping capacity of 3,400 gpm at the Twin Lakes Pump Station. Additional storage of 0.36 MG is required for Phase 2 and 0.21 MG for Phase 3. It is not practical to build storage in these increments so 0.6 MG of storage should be provided in Phase 2.

There is a possibility of future development within the District’s service boundary in the area north of Tract 53138. However, the terrain, elevation, and location of this property, along with environmental concerns, suggest that the likelihood of development is remote. Access to the property through Tract 53138 would be unlikely because of steep slopes and rugged terrain. Because development is unlikely in

this area, and would probably not be accessed through Tract 53138, the proposed facilities needed to serve Tract 53138 were not sized to serve any future developments.

Section 6 - Recycled Water

There are currently no reclaimed water facilities adjacent to the proposed development (Reference 3). The development is located in the northeast corner of the District's service area, far from any of the District's recycled water facilities. A connection to the District's recycled water system would be impractical, so the landscape will be irrigated with potable water as discussed in the previous sections.

Section 7 - Sewer System

Amended Vesting Tentative Tract No. 53138 is presently located within the Las Virgenes Municipal Water District's sewer service area. The District has extended the existing Sanitation Improvement District B by annexation to include the new development. Sanitation Improvement District B presently covers both areas west and east of Topanga Canyon Blvd. The estimated average daily sewage that will be generated by Tract 53138 is shown in **Table 5**.

TABLE 5

Sewage Generation

Land Use	Units	Daily Generation Rate (gallons/unit/day)	Daily Total (gallons/day)
Residential	314	280	87,920
Sheriff Office(10)	1,100 SFT	120 GPD/1000 SFT	132
Recreational Center (10)	4,340 SFT	200 GPD/1000 SFT	868
Existing Twin Lakes Sewer	492	224	110,146
Septic Conversion of Existing Old Twin Lake	213 (191 units + 22 undeveloped)	360	76,680
		TOTAL	**275,746**

This development is located in an area that is not within reach of the District's sewerage collection facilities (Reference 4). The Las Virgenes Municipal Water District is under agreement with the City of Los Angeles to convey and treat sewage from developments in the area.

The City of Los Angeles requires the metering of flows into their sewer system above 0.5 cfs (323,160 gallons/day) or if sewer discharge includes surface water runoff[11] this report assumed surface water runoff will not be collected and discharged to the sewer system. A separate storm drain system will collect and remove storm water from the tract. The estimated sewage generated is approximately 85% of the minimum flow required to install a meter, so a meter is not required. However, the City of Los Angeles may require a meter to be installed based on their analysis of the system. The Developer will be responsible to install an additional meter if required by the County of Los Angeles.

---

(10) Sewer Area Study for Outlet Point 1 & 2, January 5 2016

[11] Agreement Between the City of Los Angeles and the Las Virgenes Municipal Water District for the Conveyance, Treatment, and Disposal of Wastewater, July 1, 1999, Section IV.B.1.b

Section 8 - Construction Phasing and Acceptance

Construction of Amended Vesting Tentative Tract No. 53138 is anticipated to be performed in three phases. The first phase involves the construction of 102 residential units, Sheriff Facility, Recreation Building, and 21 open space lots. Phase 2 will result in the construction of 143 residential units and two open space lots. Phase 3 will complete tract development with 69 residential units and seven open space lots.

Analysis of the potable water demands, system upgrades, and proposed potable water systems were performed in Sections 3, 4, and 5, respectively. These sections analyzed the impact each construction phase.

In accordance with standard policy, the District will consider final acceptance of the potable water system when a previously defined, separately bonded phase of the project is completed. Construction shall be considered complete for a phase when all facilities related to the potable and recycled water systems have been installed in accordance with the District's standards and the approved Water System Design Report, and all meter boxes have been set to grade in concrete sidewalks.

The Developer must comply with the Special Conditions for bonds, temporary risers and hose bibs, and repair of damage to accepted water system components set forth in the District's memorandum entitled, "Review of Policy - Acceptance of Tract Water Systems (July 14, 1989)."

Section 9 - Water Conservation

To obtain maximum benefit of the limited water resources of the State of California, the State of California and the District have adopted ordinances that require plant materials and irrigation systems to be water efficient.

The State of California Model Water Efficient Landscape Ordinance (Cal. Code Regs. Titl 23, § 492.3 (2015)) specifies the development of a Landscape Documentation Package for new and rehabilitated landscaping. Significant provisions include:

- New construction projects with an aggregate landscape area equal to or greater than 500 square feet require a building or landscape permit, plan check or design review.
- Rehabilitation projects with an aggregate landscape area equal to or greater than 2,500 square feet require a building or landscape permit, plan check, or design review.
- The Maximum Applied Water Allowance (MAWA) is calculated based on an Evapotranspiration Adjustment Factor (ETAF) of 55% for residential areas and 45% for non-residential projects.
- Dedicated landscape water meters or private sub-meters are required for residential landscapes over 5,000 square feet and non-residential landscapes (in conjunction with California Code Water Code 535) of 1,000 square feet or greater.
- Turf shall not exceed 25% of the landscape area in residential areas, and there shall be no turf in non-residential areas. Turf shall not be planted on sloped areas which exceed a slope of 1 foot vertical elevation change for every 4 feet of horizontal length.

In an effort to assure the appropriate use of water, the District assesses penalties for the wasteful use of water. In 2016, the District established a water budget based billing system that designates a specific amount of water for each property. Exceeding the designated water budget for a property could result in escalating penalties. Water District Code 3-4.202 specifies:

- No customer shall knowingly permit waste or leaks of water. Where water is wastefully or negligently used on the customer's premises, the District may discontinue the service, if such conditions are not corrected within five days after the General Manager gives the customer written notice.
- A water budget shall be established for each customer of the District, and customers shall be notified of the basis for calculating their water budgets. Water use exceeding twice a customer's water budget is a waste of water, a violation of the District's rules and regulations, and shall be subject to escalating administrative penalties.

In accordance with Water District Code 3-4.402, the following water conservation measures are required:

- Customers shall conserve water supplied by the District by the prevention and elimination of all waste or leakage of water.

- For residential development, all toilets installed shall use 1.6 gallons or less per flush, and all showerheads shall flow at 2.5 gallons per minute, or less, at 80 psi.

In addition, if a model home display is to be provided, one of the models must be landscaped with water efficient (Xeriscape) plant materials and irrigated with appropriate water conserving irrigation system. Further, the Xeriscape model shall be designed to be drought tolerant, and irrigation and intensive planting are discouraged. Turf shall occupy no more than 30% of the landscaping. The model home display shall draw attention to the specific landscape materials and irrigation techniques utilized.

In accordance with Water District Code 3-4.404, specific water conservation actions must be performed including:

- Potable water shall not be used to clean or sweep hard surfaces such as sidewalks, walkways, driveways, or parking areas and only as necessary to protect the public health and safety.
- Car washing is permitted only with the use of a nozzle having an automatic shut-off.

- Fountains and other decorative water features shall recirculate water.
- Irrigation shall occur after 5:00 p.m. and before 10:00 a.m. No irrigation is permitted during and within 48 hours after measurable rainfall.
- Irrigation shall not run off to streets, gutters or adjacent properties.
- Limit the number of watering days, if and as determined by the Board, except that watering is permitted at any time with a hand-held hose equipped with an automatic shut-off, a faucet filled bucket of five gallons or less, or a drip irrigation system.

Section 3-4.406 of the Water District Code specifies that violations of ordinances are subject to penalties including increasing penalties for non-compliance.

Section 10 - Financial Impact on District

The 2014 Potable Water Master Plan determined that an additional 1.5 MG of storage and 1,878 gpm of pumping is needed in the Twin Lake Subsystem by the year 2035. The estimated cost for these future improvements were included in the total estimated cost of $32,159,050 for the facilities needed for future demand for the entire District. This total was then used in the 2016 Capacity Fee Study when calculating the incremental component of the potable water capacity fee.

Because the costs of additional storage and pumping in the Twin Lakes Subsystem were anticipated an incremental component of the potable water capacity fee the District should participate in the construction of these improvements. However, the Master Plan's estimated cost for storage did not include acquiring or construction of a tank site, providing an inlet/outlet piping to the tank or the design of the facilities. These costs are the responsibility of the developer.

In summary the responsibilities are:
Developer:

- Pay full capacity fee.
- Provide a tank site ready for construction and an inlet/outlet piping before service to any Phase 2 lots[1].
- Fund design of the facilities.

District:

- Participate in the construction of a 600,000 gallon tank concurrent with Phase 2
- Participate in the construction of 500 gpm of pumping capacity including 500 gpm of stand-by pumping concurrent with Phase 2 and 400 gpm of pumping concurrent with Phase 3 at the Twin Lakes Pump Station.

[1] The preferred location is site S-9 per the KJ Study.

Section 11 - Environmental Review

The District is a "Responsible Agency" for the purpose of environmental review of this project under the California Environmental Quality Act (CEQA). The "Lead Agency" for the environmental review of this project under the CEQA is the County of Los Angeles, Board of Supervisors. On August 10, 2004, the County Board of Supervisors certified the Final Environmental Impact Report (FEIR) (**Appendix C**). On September 16, 2008, an Amended Vesting Tentative Tract Map was approved by the County Hearing Officer. CEQA Section 15164 authorizes a Lead Agency to prepare an Addendum to a previously certified Environmental Impact Report if changes or additions to the document are necessary, provided the changes meet conditions outlined in Section 15164.

The Amended Vesting Tentative Tract No. 53138 will implement the same mitigation measures as previously approved on an appropriate pro rata basis. Since the current Amended Vesting Tentative Track Map results in a reduction of each potential impact identified in the original FEIR, a subsequent EIR is not required.

The District will act as "Lead Agency" if any further environmental reviews are required for water facilities. The developer will fund further environmental reviews for supporting improvements which were not identified or included within previous drafts of the Water System Design Report or as included within the certified FEIR. These improvements include but are not limited to additional pumping capacity, additional storage tank and site, and other improvement required for water facilities.

Section 12 - Conclusions and Recommendations

A. It is concluded that:

1. To provide adequate potable water service to the proposed development, the following facilities must be installed by the developer:

   a) The water mains shown on **Plates 2, 3, and 4**, depending on the construction phase. This study does not address in detail the alignment of this pipe and related easements.

   b) Thirty –seven (37) new fire hydrants. 35 residential fire hydrants and 2 commercial fire hydrants along with necessary mainline valves at locations approved by the District

   c) Pipeline from Twin Lakes Tanks to development's point of connection, the intersection of Topanga Canyon Boulevard and Poema Place.

   d) Twin Lakes Pump Station and Tank upgrades for capacity based on the construction phase. This study does not address in detail of the upgrades required.

   e) District to participate in the tank and pump upgrades construction.

2. All units served by the 1585-ft pressure zone below 1400-feet will experience pressures in excess of 80 psi. Each of these service connections will require an individual pressure regulator ahead of building plumbing in accordance with the 80 psi limitation imposed by the Uniform Plumbing Code.

3. All potable water system improvements served by the 1585-ft pressure zone should be designed to accommodate hydraulic gradients not less than 1585 feet.

4. Pipe appurtenances, such as backflow devices and meters, were not considered in this analysis, but maybe required by the District based on actual conditions.

5. The developer must be required to dedicate rights-of-way to the District for all pipelines, including off-site facilities, not within public streets.

6. Recycled water will not be available for irrigation of common areas within Tract 53138. Common areas will be irrigated with potable water.

7. The proposed development is located within the service area of the District's Sanitation Improvement District. The district has expanded Sanitation Improvement District B by annexation. Developer is not responsible to install a new meter as required by the agreement between City of Los Angeles Sanitation and LVMWD since the total sewage flow is less than the threshold of 0.5 cfs (323.160 gallons/day).

8. Developer may be required to install a new Sewer Meter base on County of Los Angeles flow requirement.

9. Environmental documentation, in compliance with CEQA, has been completed. However, if additional documentation is required for water facilities the District will act as “Lead Agency”.

B. It is recommended that:

1. The potable water system facilities shown on **Plates 2, 3, and 4** and outlined above be approved for installation by the developer.

2. The District requires the developer to dedicate rights-of-way for all pipelines, including off-site piping not in public streets.

3. The District require all above-ground District-owned facilities (i.e. meters larger than 2 inches, detector check installations, and backflow prevention devices) be installed above ground and screened from view in accordance with District standard plans.

4. The District will participate in the construction of additional pumping capacity and storage. The Developer shall pay in full connection fees for sewer and water services.

5. The Developer shall provide a tank ready site as well as the inlet/outlet piping before service to any lot for Phase 2 and Phase 3.

Section 13 - Limitations

Report Intent. This Water System Design Report is intended only to develop the hydraulic information necessary to design a water system. No effort has been made at this time to precisely locate existing or proposed facilities. Conflicts may develop as more information is discovered about both existing and proposed pipelines, street grades, etc. Corrections of conflicts related to this project will be the responsibility of the applicant.

Project Changes. This Water System Design Report is based upon maps of Tract 53138 prepared by United Civil Inc. dated July 2015 and upon information submitted by the developer of the subject property and his representatives. Accordingly, this design report may be subject to modification to reflect changes made by the applicant or conditions imposed by the environmental review process. This report may also be subject to modification to reflect additions or amendments to the District's Water Ordinance and the District's Design Standards prior to approval of the final design. Any revision in the above information or development map or deviation therefrom may invalidate the conclusions and recommendations. A supplemental or amended report must be prepared for the use of the District at the applicant's sole expense if the project or the data is changed.

Other Agency Approvals. This Water System Design Report has been prepared at the request of the developer of Tract 53138. Approval of this report does not indicate the District either supports or opposes the underlying project or any related project. District staff will answer questions concerning this report. However, the project proponent is solely responsible for securing necessary project approvals from state, regional, and local agencies with jurisdiction by law without the express or implied intervention or support of the District.

Project Delays. This Water System Design Report is based upon the assumption that the project will be implemented in due course. A supplement, amendment or complete report must be prepared for the use of the District at the proponent's sole expense if the project is unduly delayed.

Warranty of Supply. The approval of this Water System Design Report does not constitute a commitment by the District to supply water or provide sanitation service to the project. The project will

be assured of connection to the water and sanitation systems of the District only if the proponent also satisfies all terms and conditions for service as set forth in the District's code, and capacity is available at the time arrangements for service are finalized.

Planning for the Challenges Ahead

Richard J. Bruckner
Director

June 6, 2017

Keltie Cole, Vice President of Community Development
Foremost Companies
16130 Ventura Blvd, Suite 480
Encino, CA 91436

REGARDING: **PROJECT NO. 99-239-(5)**
OAK TREE PERMIT NO. RPPL 2017005567
ADDENDUM TO FINAL ENVIRONMENTAL IMPACT REPORT NO. 99-239

NORTH OF 118 FREEWAY BETWEEN TOPANGA CANYON ROAD AND CANOGA AVENUE, CHATSWORTH

Dear Applicant,

The Hearing Officer, Ms. Gina Natoli, by her action of June 6, 2017, has **APPROVED** the above-referenced project. Enclosed are the Hearing Officer's Findings and Conditions of Approval. Please carefully review each condition. This approval is not effective until the appeal period has ended and the required documents and applicable fees are submitted to the Regional Planning Department (see enclosed Affidavit of Acceptance Instructions).

Appeals:

The applicant or any other interested persons may appeal the Hearing Officer's decision. The appeal period for this project will end at 5:00 p.m. on June 20, 2017. **Appeals must be delivered in person.**

To file an appeal, please contact:
Regional Planning Commission, Attn: Commission Secretary
Room 1350, Hall of Records
320 West Temple Street, Los Angeles, CA 90012
(213) 974-6409

Upon completion of the appeal period, the notarized Affidavit of Acceptance and any applicable fees must be submitted to the planner assigned to your case. Please make an appointment to ensure that processing will be completed in a timely manner. Failure to submit these documents and applicable fees within 60 days will result in a referral to Zoning Enforcement for further action.

In addition, any applicable CEQA fees for the Department of Fish and Wildlife shall be paid, and a Notice of Determination, if applicable must be filed with the County Clerk according to the instructions with the enclosed Affidavit of Acceptance. A Notice of Exemption, if applicable, may also be filed according to the instructions in the enclosed Affidavit of Acceptance.

For questions or for additional information, please contact Lynda Hikichi of the Land Divisions Section at (213) 974-6433, or by email at lhikichi@planning.lacounty.gov. Our office hours are Monday through Thursday, 7:30 a.m. to 5:30 p.m. We are closed on Fridays.

Sincerely,
DEPARTMENT OF REGIONAL PLANNING
Richard J. Bruckner

Kim K. Szalay, AICP

FINDINGS OF THE HEARING OFFICER
COUNTY OF LOS ANGELES
PROJECT NO. 99-239- (5)
OAK TREE PERMIT RPPL 2017005567

1. The Los Angeles County Hearing Officer ("Hearing Officer"), Ms. Gina Natoli, conducted a duly noticed public hearing in the matter of Project No. 99-239, consisting of Oak Tree Permit ("OTP") RPPL 2017005567 on June 6, 2017.

2. The applicant, Forestar Chatsworth ("permittee"), requests an oak tree permit to authorize the removal (retroactive) of two oak trees of the oak genus *(Quercus agrifolia)* and encroachment within the protected zone of one oak tree ("Project"). The Deerlake Ranch Project entails 368 lots, including 314 single-family lots (including three flag lots), one park lot, one Sheriff Station lot, one horse rest area lot, one debris basin lot, one helispot lot (later revised as a dog park), one recreational center lot, 25 open space lots, 23 private driveway and fire lane lots, and one remainder parcel. The Deerlake Ranch Project has been conditioned to provide off-site improvements to extend a sewer line to provide service to the Twin Lakes residential community.

3. The Deerlake Ranch and Twin Lakes Sewer Improvement project sites are located north of 118 Freeway (Ronald Reagan Freeway) between Canoga Avenue and Topanga Canyon Boulevard, within the Chatsworth Zoned District.

4. The Deerlake Ranch Project site is 232 gross acres and irregularly-shaped with flat to hilly terrain. A large portion of the property is generally a plateau that is bordered to the west and south by Devil's Canyon and to the east by Brown's Canyon. The Deerlake Ranch Project site is vacant. Twin Lakes is a residential community located south of the Deerlake Ranch Project site.

5. The access to the Deerlake Ranch Project site is via Poema Place (a 64-foot-wide dedicated public street) and Canoga Avenue (a variable-width dedicated public street). The proposed two entry gates are located at the intersections of Poema Place and Bull Finch Road, and Poema Place and Canoga Avenue. The residences located behind the entry gates will take access from internal private driveways and fire lanes, which take access from Poema Place and Canoga Avenue.

6. The Deerlake Ranch property is depicted within the Non-Urban (R) and Rural Communities (RC) land use categories of the Los Angeles Countywide General Plan ("General Plan"). The Rural Communities designation permits residential density of one to six dwelling units per acre. The Non-Urban designation permits a maximum density of one dwelling unit per acre.

7. The Deerlake Ranch project site is currently zoned A-1-1 (Light Agricultural – One-Acre Minimum Required Lot Area) and R-1-6,000 (Single-Family Residential - 6,000 Square Feet Minimum Required Lot Area). The project site has been

zoned R-1-6,000 and A-1-1 since the adoption of Ordinance 7505 on April 14, 1959. The Ordinance became effective on May 15, 1959.

8. The Deerlake Ranch Project is required to comply with the development standards of the A-1-1 and R-1-6,000 Zones. Single-family residences are permitted uses within the A-1-1 and R-1-6,000 Zones.

9. The Exhibit "A" to Oak Tree Permit RPPL 2017005567 depicts both the Deerlake Ranch and Twin Lakes Sewer Improvement Project sites. The Exhibit "A" shows the locations and their impacts for the 154 inventoried oak trees. Sheet 1 of the Oak Tree Impact Exhibit and Protection Plan is illustrated in larger scale, and shows the Twin Lakes Sewer Improvement Project site and the southern portion of the Deerlake Ranch Project site. Sheet 2 of the Oak Tree Impact Exhibit and Protection Plan is also illustrated in larger scale and shows the northern portion of the Deerlake Ranch Project site. The Exhibit maps depict 153 oak trees. Oak tree #85 is located 1,400 feet northeast of the project site and is not depicted on the maps. The Exhibit maps list 154 oak trees, which includes 58 oak tree removals, 39 encroachments (24 encroachments within the Deerlake Ranch and 15 encroachments within the Twin Lakes Sewer Improvement project sites), and 57 oak trees (55 oak trees within the Deerlake Ranch and two oak trees within Twin Lakes) with no impacts.

10. Per Oak Tree Permit No. 201200001 and Oak Tree Permit RPPL 2016003378, fifty-five (55) oak trees have already been removed: 1, 2, 3, 4, 5, 6, 7, 11, 12, 13, 14, 31, 41, 42, 43, 44, 45, 46, 47, 48, 49, 50, 51, 52, 53, 55, 64, 66, 73, 76, 83, 86, 87, 95, 96, 97, 98, 99, 100, 101, 102, 103, 110, 111, 112, 113, 114, 115, 117, 118, 119, 120, 121, 122, and 123. Oak Tree #124 is permitted for removal per Oak Tree Permit RPPL 2016003378 but still standing.

11. Per Oak Tree Permit RPPL 2016003378, the following oak trees are approved for encroachments into their protected zones within the Deerlake Ranch Project site: 8, 9, 21, 22, 23, 24, 25, 26, 27, 57, 58, 59, 60, 67, 68, 74, 84, 142, 143, 144, 145, 146, and 154. Within the Twin Lakes Sewer Improvement Project site, a total of 15 encroachments into the protected zones are approved: 125, 126, 128, 129, 130, 131, 132, 133, 134, 135, 136, 137, 138, 139, and 147.

12. Oak Tree Permit RPPL 2017005567 authorizes the retroactive removal of two oak trees (#54 and #56) and encroachment into the protected zone of one oak tree (#29). Oak Trees No. 54 and 56 were permitted for encroachment under Oak Tree Permit RPPL 2016003378. Oak Trees No. 54 and 56 were accidentally removed on December 6, 2016. Oak Tree No. 29 is a new encroachment and has a potential for impact due to its close proximity to the Poema bridge construction activities.

13. The Forester recommends approval of this Project and finds that the Oak Tree Report is accurate and complete as to the location, size, condition and species of the oak trees on the site.

14. The Forester issued a letter on March 8, 2017 recommending approval of the OTP, which included a list of requirements and conditions.

15. An Addendum to the certified Final Environmental Impact Report ("FEIR") No. 99-239 for the original tentative tract map and associated permits was prepared in compliance with the California Environmental Quality Act ("CEQA") and the County environmental guidelines. The Addendum concluded that the proposed oak tree permit would not result in any increased or additional environmental impacts beyond those which were analyzed in the FEIR, and therefore concluded that a supplemental environmental analysis was not required.

16. The Deerlake Ranch property contains an Oak Woodland, as defined by the California Department of Fish and Game Code Section 1361.h and by the *Los Angeles County Oak Woodlands Conservation Management Plan Guide.* Regional Planning staff has determined there may be impacts to this resource for the Project.

17. No comments have been received from the public at this time.

18. At the June 6, 2017 public hearing, Keltie Cole (Vice President of Community Development, Forestar Chatsworth, LLC) made a presentation. Ms. Cole stated that the two removals were accidental. Immediately after the removals, the Forester and the Department of Regional Planning were notified of the accidental removals. Ms. Cole expressed that even though Forestar has met the mitigation requirements pursuant to the FEIR, Forestar has already purchased 16 big boxed oak trees (eight per removal) to provide as additional mitigation. Ms. Cole asked if the seven-year monitoring period may be modified to two years.

    The Hearing Officer addressed the issue of the monitoring period and stated that it takes longer to determine whether the oaks are going to survive and therefore, the monitoring period is seven years and not two years. The Hearing Officer expressed that she was concerned with the long-term survival rate of big boxed trees, and therefore, will require an eight to one (8:1) mitigation of 1-gallon and 15-gallon trees.

    Christy Cuba (arborist) and Peter Gutierrez (applicant's representative from Latham & Watkins) were also available to answer questions.

19. The Hearing Officer finds that the Deerlake Ranch Project site is located within the Non-Urban (R) and Rural Communities (RC) land use categories of the Los

Angeles Countywide General Plan ("General Plan"). The Rural Communities designation permits residential density of one to six dwelling units per acre. The Non-Urban designation permits a maximum density of one dwelling unit per acre. Non-urban residential uses are permitted subject to established density, design and service standards, and rural communities are essentially clustered non-urban settlements that vary in terms of size and intensity of development. The proposed clustered development of 314 single-family residential lots is consistent with the permitted uses of the underlying land use categories.

20. The Hearing Officer finds that the Deerlake Ranch Project site is located within the R-1-6,000 and A-1-1 Zones. The proposed single-family residential uses are consistent with the permitted uses of the underlying zones. The proposed project will be subject to all development standards and guidelines of the R-1 and A-1 Zones.

21. The Hearing Officer finds that the Project satisfies the Oak Tree Permit Burden of Proof findings in Section 22.56.2060 of the County Code. The proposed use can be accomplished without endangering the health of the remaining oak trees on the project sites. An oak tree report has been prepared by Carlberg Associates, the consulting arborist.

22. In addition to the mitigation measures, protective measures recommended by the Forester, consulting arborist, and Department staff biologist will be placed to help protect the remaining trees and will help to avoid harmful effects. The removals were undertaken for the development of 314 single-family residences, driveways and fire lanes, etc. The encroachments are also necessary and unavoidable for the development of 314 single-family homes and the sewer line extensions within the Twin Lakes residential community. The oak tree removals and encroachments for the Deerlake Ranch Project and the Twin Lakes Sewer Improvement Project will not be contrary to or be in substantial conflict with the intent and purpose of the oak tree permit procedure. The subject two oak trees were accidentally removed and should have been avoided.

23. The Hearing Officer finds that, at the suggestion of the applicant, mitigation trees of the oak genus must be provided at a ratio of eight to one for each oak tree removed for a minimum total of 16 required mitigation trees, in accordance with the provisions of County Code Section 22.56.2180.A.6.

24. Although the permittee has already delivered 122 mitigation oak trees to the MRCA for planting, which was based on the proposed 61 oak tree removals in 2004, pursuant to the FEIR, the permittee proposed to plant an additional 16 oak trees for the two oak tree removals.

25. The Hearing Officer finds that an acorn of the same species must be planted within the irrigation circle of each mitigation oak tree.

26. The Hearing Officer finds that the property is within an Oak Woodland as defined by the California Department of Fish and Game Code Section 1361.h as "an oak stand with a greater than 10 percent canopy cover or that may have historically supported greater than 10 percent canopy cover." The staff biologist has confirmed that the Deerlake Ranch Project site contains Oak Woodland. Because of the Oak Woodland, the Project was reviewed by the staff biologist, who provided recommendations for the project. The policies of the *Los Angeles County Oak Woodlands Conservation Management Plan Guide* were also used to review the Project.

27. The Hearing Officer finds that the proposed Project may have a substantial adverse effect on the Oak Woodland. Implementation of the Forester's recommendations will protect the remaining trees and the integrity of the Oak Woodland. Planting of mitigation trees in the off-site conserved area will establish new oak woodland and restore oak woodland in a conserved area of the same watershed and comply with the State Oak Woodlands requirements of PRC §21083.4.

    The Hearing Officer finds that the recommendation by the staff biologist for a monitoring period of seven years instead of two for the oak trees is necessary.

28. An addendum to the Final Environmental Impact Report has been recommended as the appropriate environmental document for this project pursuant to the California Environmental Quality Act ("CEQA") and the Los Angeles County Environmental Guidelines. It was determined that, pursuant to CEQA Guidelines Section 15164, some changes to the previously certified FEIR are necessary but none of the conditions described in CEQA Guidelines Section 15162, calling for the preparation of a subsequent EIR, have occurred.

29. The Hearing Officer finds that pursuant to the provisions of Section 22.56.2130 of the County Code, the community was appropriately notified of the public hearing by newspapers (The Daily News and La Opinion), library postings, and Department of Regional Planning ("Regional Planning') website posting. A total of 15 postcard notices were mailed to those on the courtesy mailing list. Library packages consisting of project materials were sent to the Chatsworth Branch Library and the San Fernando County Library.

30. A duly noticed public hearing was held on June 6, 2017 before the Hearing Officer. Staff recommended approval of the oak tree permit and Addendum to the Final Environmental Impact Report.

31. The location of the documents and other materials constituting the record of proceedings upon which the Hearing Officer's decision is based in this matter is the Los Angeles County Department of Regional Planning, 13th Floor, Hall of Records, 320 West Temple Street, Los Angeles, California 90012. The custodian of such documents and materials shall be the Section Head of the Land Divisions Section, Regional Planning.

BASED ON THE FOREGOING, THE HEARING OFFICER CONCLUDES THAT:

A. The proposed construction of the proposed use will be accomplished without endangering the health of the remaining trees subject to Part 16 of Chapter 22.56, Title 22 of the County Code, on the subject property. Monitoring the health of the remaining trees will provide information on whether additional mitigation trees are needed for planting on the off-site mitigation area.

B. In addition to the above facts, the following finding applies: The removal of the oak trees proposed is necessary as continued existence at the present locations frustrates the planned improvement or proposed use of the subject property to such an extent that placement of such trees precludes the reasonable and efficient use of such property for a use otherwise authorized.

C. The removal or the encroachment of the oak trees proposed will not be contrary to or be in substantial conflict with the intent and purpose of the oak tree permit procedure.

THEREFORE, THE HEARING OFFICER

1. Adopts the addendum to the FEIR and certifies that it has been completed in compliance with CEQA and the State and County guidelines related thereto.

2. Approves Oak Tree Permit RPPL 2017005567, subject to the attached conditions and recommendations.

KKS:LKH
June 6, 2017

CONDITIONS OF APPROVAL
COUNTY OF LOS ANGELES
PROJECT NO. 99-239-(5)
OAK TREE PERMIT RPPL 2017005567

PROJECT DESCRIPTION

The applicant, Forestar Chatsworth ("permittee"), requests an oak tree permit to authorize the removal (retroactive) of two oak trees of the oak genus *(Quercus agrifolia)* and encroachment within the protected zone of one oak tree ("Project"). The Deerlake Ranch Project entails 368 lots, including 314 single-family lots (including three flag lots), one park lot, one Sheriff Station lot, one horse rest area lot, one debris basin lot, one helispot lot (later revised as a dog park), one recreational center lot, 25 open space lots, 23 private driveway and fire lane lots, and one remainder parcel. The Deerlake Ranch Project has been conditioned to provide off-site improvements to extend a sewer line to provide service to the Twin Lake residential community.

GENERAL CONDITIONS

1. Unless otherwise apparent from the context, the term "permittee" shall include the applicant, owner of the property, and any other person, corporation, or other entity making use of this grant.

2. This grant shall not be effective for any purpose until the permittee, and the owner of the subject property if other than the permittee, have filed at the office of the County Department of Regional Planning ("Regional Planning") their affidavit stating that they are aware of and agree to accept all of the conditions of this grant. Notwithstanding the foregoing, this Condition No. 2 and Conditions No. 4, 5, and 8 shall be effective immediately upon the date of final approval of this grant by the County.

3. Unless otherwise apparent from the context, the term "date of final approval" shall mean the date the County's action becomes effective pursuant to Section 22.60.260 of the County Code.

4. The permittee shall defend, indemnify, and hold harmless the County, its agents, officers, and employees from any claim, action, or proceeding against the County or its agents, officers, or employees to attack, set aside, void, or annul this permit approval, which action is brought within the applicable time period of Government Code Section 65009 or any other applicable limitations period. The County shall promptly notify the permittee of any claim, action, or proceeding and the County shall reasonably cooperate in the defense. If the County fails to promptly notify the permittee of any claim, action, or proceeding, or if the County fails to cooperate reasonably in the defense, the permittee shall not thereafter be responsible to defend, indemnify, or hold harmless the County.

5. In the event that any claim, action, or proceeding as described above is filed against the County, the permittee shall within 10 days of the filing make an initial deposit with Regional Planning in the amount of up to $5,000.00, from which actual costs and expenses shall be billed and deducted for the purpose of defraying the costs or expenses involved in Regional Planning's cooperation in the defense, including but not limited to, depositions, testimony, and other assistance provided to permittee or permittee's counsel.

   If during the litigation process, actual costs or expenses incurred reach 80 percent of the amount on deposit, the permittee shall deposit additional funds sufficient to bring the balance up to the amount of $5,000.00. There is no limit to the number of supplemental deposits that may be required prior to completion of the litigation.

   At the sole discretion of the permittee, the amount of an initial or any supplemental deposit may exceed the minimum amounts defined herein. Additionally, the cost for collection and duplication of records and other related documents shall be paid by the permittee according to County Code Section 2.170.010.

6. If any material provision of this grant is held or declared to be invalid by a court of competent jurisdiction, the permit shall be void and the privileges granted hereunder shall lapse.

7. Upon any transfer or lease of the property during the term of this grant, the permittee, or the owner of the subject property if other than the permittee, shall promptly provide a copy of the grant and its conditions to the transferee or lessee of the subject property.

8. This grant shall expire unless used within two (2) years from the recordation date of the final phasing map. A single one-year time extension may be requested in writing and with the payment of the applicable fee prior to such expiration date.

9. The subject property shall be maintained and operated in full compliance with the conditions of this grant and any law, statute, ordinance, or other regulation applicable to any development or activity on the subject property. Failure of the permittee to cease any development or activity not in full compliance shall be a violation of these conditions. The permittee shall deposit with the County the sum of **$1,400.00**. The deposit shall be placed in a performance fund, which shall be used exclusively to compensate Regional Planning for all expenses incurred while inspecting the premises to determine the permittee's compliance with the conditions of approval. The fund provides for **seven** annual inspections. The required inspection shall be unannounced.

10. If additional inspections are required to ensure compliance with the conditions of this grant, or if any inspection discloses that the subject property is being used in violation of any one of the conditions of this grant, the permittee shall be

financially responsible and shall reimburse Regional Planning for all enforcement efforts necessary to bring the subject property into compliance. The amount charged for inspections shall be $200.00 per inspection, or the current recovery cost at the time any additional inspections are required, whichever is greater.

11. Notice is hereby given that any person violating a provision of this grant is guilty of a misdemeanor. Notice is further given that the Regional Planning Commission ("Commission") or a Hearing Officer may, after conducting a public hearing, revoke or modify this grant, if the Commission or Hearing Officer finds that these conditions have been violated or that this grant has been exercised so as to be detrimental to the public's health or safety or so as to be a nuisance, or as otherwise authorized pursuant to Chapter 22.56, Part 13 of the County Code.

12. All development pursuant to this grant must be kept in full compliance with the County Fire Code to the satisfaction of the Fire Department.

13. All development pursuant to this grant shall conform with the requirements of the County Department of Public Works to the satisfaction of said department.

14. All development pursuant to this grant shall comply with the requirements of Title 22 of the County Code and of the specific zoning of the subject property, unless specifically modified by this grant, as set forth in these conditions, including the approved Exhibit "A," or a revised site plan approved by the Director of Regional Planning ("Director").

15. The permittee shall maintain the subject property in a neat and orderly fashion. The permittee shall maintain free of litter all areas of the premises over which the permittee has control.

16. All structures, walls and fences open to public view shall remain free of graffiti or other extraneous markings, drawings, or signage that was not approved by Regional Planning. These shall include any of the above that do not directly relate to the business being operated on the premises or that do not provide pertinent information about said premises. The only exceptions shall be seasonal decorations or signage provided under the auspices of a civic or non-profit organization.

    In the event of graffiti or other extraneous markings occurring, the permittee shall remove or cover said markings, drawings, or signage within 24 hours of notification of such occurrence, weather permitting. Paint utilized in covering such markings shall be of a color that matches, as closely as possible, the color of the adjacent surfaces.

17. The permittee shall record the conditions and provide a copy of the recordation to the Department of Regional Planning.

PERMIT-SPECIFIC CONDITIONS

18. The permittee shall comply with all mitigation measures contained in the Mitigation Monitoring Program ("MMP") associated with Final Environmental Impact Report ("FEIR") 99-239.

19. This grant shall authorize the removal of two oak trees (#54 and #56) and one encroachment (#29) as shown on the Exhibit Maps.

20. The permittee shall plant one acorn of the same species of oak (Quercus agrifolia), at the same time as and within the irrigation circle of each mitigation oak tree.

21. The permittee shall comply with all conditions and requirements contained in the County Forester and Fire Warden, Forestry Division, letter dated March 8, 2017 (attached hereto), to the satisfaction of said Division, except as otherwise required by said Division, and as specified by these conditions below:

    a. The maintenance period for mitigation trees, as addressed in Condition No. 14 in the letter, shall be seven (7) years.
    b. With respect to removal of tree canopy as addressed in Condition No. 8 in the letter, no more than 15 percent of the canopy of any one tree shall be removed.
    c. The permittee shall provide mitigation trees of the species Quercus agrifolia at a rate of eight to one (8:1) for each of the two trees removed, for a total of 16 trees. The permittee shall provide mitigation trees of the species Quercus agrifolia at a rate of three to one (3:1) for Oak Tree #29, if Oak Tree #29 dies as a result of the approved encroachment.
    d. With respect to the size of the mitigation trees as addressed in Condition No. 11 in the letter, eight of the 16 mitigation trees shall each be one gallon in size and shall be planted in the vicinity where Oak Trees #54 and #56 were removed. Eight of the 16 mitigation trees shall be 15-gallon specimens and shall be provided to the Mountains Recreation and Conservation Authority for planting in the Brown's Canyon mitigation site, or adjacent to the onsite oak woodland south of the Sullivan Bridge.

FIRE CHIEF
FORESTER & FIRE WARDEN

March 8, 2017

Lynda Hikichi, Planner
Department of Regional Planning
Zoning Permits Section
320 West Temple Street
Los Angeles, CA 90012

Dear Lynda Hikichi:

OAK TREE PERMIT NUMBER RPPL 2017-005567
PROJECT NUMBER 99-239
DEERLAKE RANCH PROJECT, CHATSWORTH

We have reviewed the "Request for Oak Tree Permit #RPPL 2017-005567." The project is located at Deerlake Ranch Project in the unincorporated area of Chatsworth. The Oak Tree Report is accurate and complete as to the location, size, condition and species of the Oak trees on the site. The term "Oak Tree Report" refers to the document on file by Christy Cuba, the consulting arborist, dated January 10, 2017.

We recommend the following as conditions of approval:

OAK TREE PERMIT REQUIREMENTS:

1. This grant shall not be effective until the permittee and the owner of the property involved (if other than the permittee), have filed at the office of the Department of Regional Planning their affidavit stating that they are aware of and agree to accept all conditions of this grant. Unless otherwise apparent from the context, the term "permittee" shall include the applicant and any other person, corporation or other entity making use of this grant.

2. The permittee shall, prior to commencement of the use authorized by this grant, deposit with the County of Los Angeles Fire Department a sum of $300. Such fees shall be used to compensate the County Forester $100 per inspection to cover expenses incurred while inspecting the project to determine the permittee's compliance with the conditions of

approval. The above fees provide for one (1) initial inspection prior to the commencement of construction and two (2) subsequent inspections until the conditions of approval have been met. The Director of Regional Planning and the County Forester shall retain the right to make regular and unannounced site inspections.

3. Before commencing work authorized or required by this grant, the consulting arborist shall submit a letter to the Director of Regional Planning and the County of Los Angeles Fire Department's Forestry Division stating that he or she has been retained by the permittee to perform or supervise the work, and that he or she agrees to report to the Director of Regional Planning and the County Forester, any failure to fully comply with the conditions of the grant. The arborist shall also submit a written report on permit compliance upon completion of the work required by this grant. The report shall include a diagram showing the exact number and location of all mitigation trees planted as well as planting dates.

4. The permittee shall arrange for the consulting arborist or a similarly qualified person to maintain all remaining Oak trees on the subject property that are within the zone of impact as determined by the County Forester for the life of the Oak Tree Permit or the Conditional Use Permit.

5. The permittee shall install temporary chainlink fencing, not less than four (4) feet in height, to secure the protected zone of all remaining Oak trees on site as necessary. The fencing shall be installed prior to grading or tree removal, and shall not be removed without approval of the County Forester. The term "protected zone" refers to the area extending five (5) feet beyond the dripline of the Oak tree (before pruning), or fifteen (15) feet from the trunk, whichever is greater.

6. Copies of the Oak Tree Report, Oak tree map, mitigation planting plan and conditions of approval shall be kept on the project site and available for review. All individuals associated with the project as it relates to the Oak resource shall be familiar with the Oak Tree Report, Oak tree map, mitigation planting plan and conditions of approval.

PERMITTED OAK TREE REMOVAL AND ENCROACHMENT:

7. This grant allows the removal of two (2) trees of the Oak genus (*Quercus agrifolia*) identified as Tree Number 54 and 56 on the applicant's site plan and Oak Tree Report. This grant allows encroachment within the protected zone of one (1) tree of the Oak genus identified as Tree Number 29 on the applicant's site plan and Oak Tree Report. Trenching, excavation, or clearance of vegetation within the protected zone of an Oak tree shall be accomplished by the use of hand tools or small hand-held power tools. Any major roots encountered shall be conserved and treated as recommended by the consulting arborist.

8. In addition to the work expressly allowed by this permit, remedial pruning intended to ensure the continued health of a protected Oak tree or to improve its appearance or structure may be performed. Such pruning shall include the removal of deadwood and stubs and medium pruning of branches two-inches in diameter or less in accordance with

the guidelines published by the National Arborist Association. Copies of these guidelines are available from the County of Los Angeles Fire Department, Forestry Division. In no case shall more than 20% of the tree canopy of any one tree be removed.

9. Except as otherwise expressly authorized by this grant, the remaining Oak trees shall be maintained in accordance with the principles set forth in the publication, "Oak Trees: Care and Maintenance," prepared by the County of Los Angeles Fire Department, Forestry Division. A copy of the publication is enclosed with these conditions.

MITIGATION TREES:

10. The permittee shall provide mitigation trees of the Oak genus at a rate of two to one (2:1) for each tree removed for a total of four (4) trees. The permittee shall provide mitigation trees of the Oak genus at a rate of two to one (2:1) for any tree specified above that dies as a result of the approved encroachments. In addition, any tree that reaches ordinance size during the life of the project shall be included in this permit and subject to these conditions of approval.

11. Each mitigation tree shall be at least a 15-gallon specimen in size and measure one (1) inch or more in diameter one (1) foot above the base. Free form trees with multiple stems are permissible provided the combined diameter of the two (2) largest stems of such trees measure a minimum of one (1) inch in diameter one (1) foot above the base.

12. Mitigation trees shall consist of indigenous varieties of *Quercus agrifolia*, grown from a local seed source.

13. Mitigation trees shall be planted within one (1) year of the permitted Oak tree removals. Mitigation trees shall be planted either on site or at an off-site location approved by the County Forester. Alternatively, a contribution to the County of Los Angeles Oak Forest Special Fund may be made in the amount equivalent to the Oak resource loss. The contribution shall be calculated by the consulting arborist and approved by the County Forester according to the most current edition of the International Society of Arboriculture's "Guide for Plant Appraisal."

14. The permittee shall properly maintain each mitigation tree and shall replace any tree failing to survive due to a lack of proper care and maintenance with a tree meeting the specifications set forth above. The two-year maintenance period will begin upon receipt of a letter from the permittee or consulting arborist to the Director of Regional Planning and the County Forester indicating that the mitigation trees have been planted. The maintenance period of the trees failing to survive two (2) years will start anew with the new replacement trees. Subsequently, additional monitoring fees shall be required.

15. All mitigation Oak trees planted as a condition of this permit shall be protected in perpetuity by the Los Angeles County Oak Tree Ordinance once they have survived the required maintenance period.

NON-PERMITTED ACTIONS AND VIOLATIONS:

16. Encroachment within the protected zone of any additional tree of the Oak genus on the project site is prohibited.

17. Should encroachment within the protected zone of any additional tree of the Oak genus on the project site not permitted by this grant result in its injury or death within two (2) years, the permittee shall be required to make a contribution to the Los Angeles County Oak Forest Special Fund in the amount equivalent to the Oak resource damage/loss. Said contribution shall be calculated by the consulting arborist and approved by the County Forester according to the most current edition of the International Society of Arboriculture's "Guide for Plant Appraisal."

18. No planting or irrigation system shall be installed within the dripline of any Oak tree that will be retained.

19. Utility trenches shall not be routed within the protected zone of an Oak tree unless the serving utility requires such locations.

20. Equipment, materials and vehicles shall not be stored, parked, or operated within the protected zone of any Oak tree. No temporary structures shall be placed within the protected zone of any Oak tree.

21. Violations of the conditions of this grant shall result in immediate work stoppage or in a notice of correction depending on the nature of the violation. A time frame within which deficiencies must be corrected will be indicated on the notice of correction.

22. Should any future inspection disclose that the subject property is being used in violation of any one of the conditions of this grant, the permittee shall be held financially responsible and shall reimburse the County of Los Angeles Fire Department, Forestry Division, for all enforcement efforts necessary to bring the subject property into compliance.

To schedule a County Forester inspection, please contact the Environmental Review Unit at (818) 890-5719.

If you have any additional questions, please contact this office at (818) 890-5758.

Very truly yours,

J. LOPEZ, ASSISTANT CHIEF, FORESTRY DIVISION
PREVENTION SERVICES BUREAU

APPENDIX D

Technical Memo

Date: Wednesday, July 05, 2017 Revised 8-30-17[1]

Project: Tract 53138 (Deerlake Ranch)

To: Eric Schlageter, Las Virgenes MWD

From: Dan Ellison, PE

Subject: Water Demand Estimate Study

This memorandum summarizes the results of HDR's analysis of the water demands projected for Tract 53138 (Deerlake Ranch). These estimated demands are intended to guide the sizing of water facilities to service this tract. Deerlake Ranch is a long-planned development at the extreme northern boundary of the Las Virgenes MWD (LVMWD) system, in the hills north of the San Fernando Valley. This development will receive water from the Twin Lakes Subsystem—part of the Las Virgenes MWD system.

As with other water demand estimates, this analysis is intended to be conservative—meaning it needs to be equal to or higher than the actual demands, otherwise fire flows and customer demands will not be met. For this particular case, a conservative estimate is particularly needed, since the existing Twin Lakes Pump Station and Tanks cannot be readily increased in capacity, should the estimates fall short. To avoid over-conservatism, a detailed estimate has been prepared, using the best available information.

Overview - How Water Demands are Estimated

Water demands vary by the hour, the season, and the year. Weather plays a major factor. Hot-dry weather drives up irrigation demands, while conservation measures created by severe droughts can suppress demands. In the District's 2014 Master Plan, it was demonstrated that economic conditions also play a major role, with demands significantly depressed during economic recessions. Water system planning must factor in these many variables, with the goal of meeting the demands of the peak hour, on the maximum day, when the development is fully built-out and occupied.

Water demand estimates for residential developments are typically computed by combining estimates of average annual indoor and outdoor use, then applying peaking factors that account for variations in seasonal and daily demands. Because outdoor use dominates, maximum-day demands occur in the summer. Peak-hour demands generally occur around 7AM, when irrigation systems are operating while residents are also showering before work and school.

LVMWD recently adopted a rate structure based on individual "water budgets". Like rates at most California water utilities, the prices are tiered, with rates escalating as usage increases. The purpose is to encourage water conservation. In budget-based rates, different tiers are set

[1] Several small errors have been corrected. See highlighted text on p.10.

for each residential customer, based on the number of persons residing in the home, the landscaped area, and other factors. Budget goals are for efficient water use. The study which established these rates found that only 40 percent of customers were expected to conform to their budgets, and more than 40 percent were expected to exceed their budgets by at least 50 percent. A recent analysis of billing data from LVMWD showed that 27 percent of all customers were exceeding their budgets by 100 percent or more, with many consistently paying significant monetary penalties. A similar exceedance is found in the Twin Lakes zone. It is thus expected that many Deerlake Ranch customers will also exceed their water budget goals.

Relevant Features of Deerlake Ranch

Demands at a typical Deerlake Ranch residence are expected to be somewhat higher than for the average LVMWD customer, for several reasons:

- The average lot size is relatively large (one-third acre).
- The tract is well inland, so is generally hotter and drier than many other areas of the District.
- New developments such as this also tend to have larger houses, and newer houses are also generally purchased by more affluent buyers.

Somewhat countering these factors, new developments are constructed with water-efficient appliances and plumbing fixtures, and frequently employ drought-tolerant landscaping. Similar relatively young developments nearby are LVMWD's Upper Twin Lakes Zone to the west and LADWP's Porter Ranch area to the east.

Water for the Deerlake Ranch development will be delivered through Metropolitan Water District's LV-3 Turnout and pumped through LVMWD's Twin Lakes Pump Station (PS). Twin Lakes Tanks 1 and 2 serve to moderate between pumping capacity and demands and also store water for emergencies and fire protection. During peak morning hours, water flows from these tanks, and during afternoons and evenings, storage is replenished. Twin Lakes PS also provides flows to the Upper Twin Lakes (UTL) system. Although the UTL system has its own tank, all its water must first be pumped by the Twin Lakes PS.

The Twin Lakes system is designed for pumping to occur 18 hours on peak days. By avoiding pumping during the afternoons, peak electricity rates are avoided. The difference between 18-hour and 24-hour operations also provides a buffer for emergencies and for refilling the tanks following a fire. The 18-hour pumping criterion also provides a small margin for error.

Table 1 shows the current capacities and current demands of the Twin Lakes facilities, based on the District's 2014 Water Master Plan.

Table 1. 2014 Capacities and Demands on Twin Lakes System Facilities – 18-hour Pumping Criterion

	Capacity	Required	Surplus
Twin Lakes PS	1875 gpm[2]	1533 gpm	342 gpm
Twin Lakes Tanks 1 & 2	2.0 MG[3]	1.96 MG	0.04 MG

Indoor Water Use

Estimated indoor water use is based on: (1) the number of homes and other facilities, (2) the number of persons per household, and (3) estimated per capita indoor use.

(1) Deerlake Ranch will consist of 314 single-family homes. Additionally a sheriff's substation and community center with swimming pool are planned.

(2) The number of persons per household is conservatively taken as 3.0, based on the following data from the 2010 Census:

Table 2. Population Data for Deerlake Ranch Area

Census Tract	9203.03	1082.02	1082.01
Area	Twin Lakes / Deerlake Ranch	Western Porter Ranch	Eastern Porter Ranch
Population	1,446	4,895	5,551
Households	560	1,826	1,848
Persons per household	2.6	2.7	3.0

(3) Per capita indoor use is conservatively taken as 80 gallons per capita per day (gpcd), based on the following data:

Table 3. Per capita indoor water consumption

Reference	GPCD	Remarks
LVMWD Water Budget Goal	55	Based on State Water Conservation Act SBx7-7
2014 LVMWD Sanitation Master Plan	90	Based on influent to Tapia Water Recycling Facility of 240 to 280 gallons per day per ERU[4]
2008 LVMWD Sanitation Master Plan	95	Based on influent to Tapia Water Recycling Facility of 247 gallons per day per ERU

Over the last 20 years, indoor use has steadily decreased, as water-efficient toilets, washers, and other devices have been adopted. Deerlake Ranch homes will have modern, water-efficient plumbing fixtures and appliances, therefore water use should be less than 90 gallons per capita per day. However, consumption elsewhere shows that usage will be above the 55 gallons per day budget goal.

[2] Pump station capacity: 2500 gpm for 18 hours per day, is average of 1875 gpm
[3] Actual usable capacity is 1.87 MG, producing a ~0.1MG deficit.
[4] ERU = Equivalent residential unit; e.g., a house, apartment, or equivalent commercial / industrial property.

If indoor usage exceeds budget allocations in proportion to the overall budget exceedances, 80 GPCD would be expected.[5]

Estimated Indoor Use

Using the figures above, estimated average annual indoor water use is as shown below.

Table 4. Estimated Indoor Water Use

Customer Type	Units	Persons per Unit	Daily Per Capita Use (gal)	Total (gallons/day)
Houses	314	3.0	80	75,000[6]
Substation	1	2	30	60
Recreation Center	1	5	50	250
Total (rounded)				75,000
Total in gpm				**52**

Outdoor Water Use

Estimated outdoor water use is based on: (1) the types of land use, (2) the land areas irrigated, and (3) the estimated unit irrigation demands.

(1) **Land Use**. The Deerlake Ranch development will be constructed in hilly terrain. Houses will sit on level pads, with varying amounts of backyard space. Frequently, the lots are very deep, extending into large sloped areas that are either natural or graded. Outside of the individually owned lots, common-area properties abut many of the roads or have terrace drains for conveyance of runoff. Many of these common areas will be graded, but some will be left in a natural state. All graded areas (both cut and fill) will have landscaping, which must be irrigated. Figure 1 (next page) illustrates some of the various conditions.

(2) **Irrigated Areas**: The various land areas, based on an analysis of data provided by the developer, are summarized in Table 5 (next page). For this analysis, 75 percent of the level area of each lot is assumed to be irrigated, after subtracting the areas occupied by the house and driveway. The other 25 percent is assumed to be hardscaped (patio, walkways, etc.)

(3) **Unit Demands**. Unit irrigation demands vary, depending on the types of plants, rainfall, the evapotranspiration rate (ETo) and the efficiency of water use. Various unit demands are shown in Table 6 (next page).

[5] Using budget exceedance figures, 80 gpcd is the overall result if: (1) 40% use 55 gpcd; (2) 27% use 2 x 55 gpcd, and (3) 33% use 1.5 x 55 gpcd.
[6] This compares to a water budget of 50,000 per day.

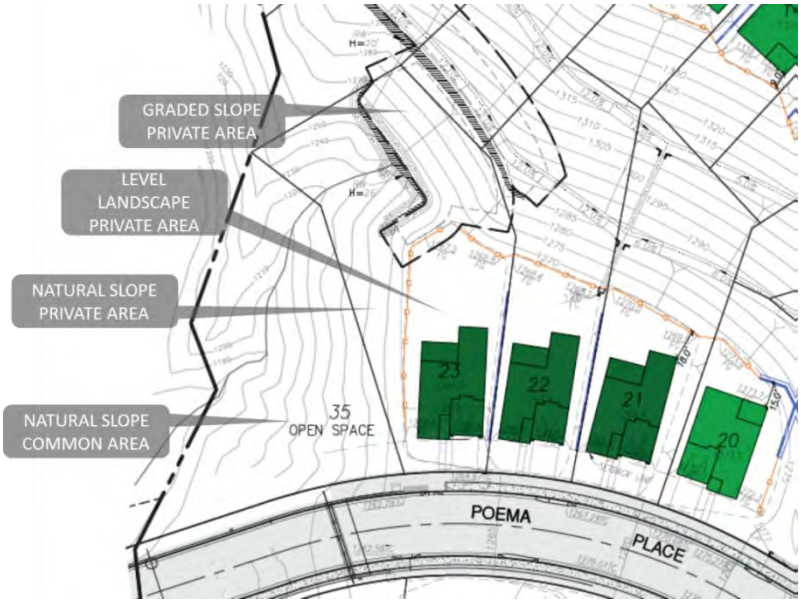

Figure 1. Illustration of various site conditions at Deerlake Ranch

Table 5. Calculated areas in Deer Lake Ranch

Land Use	Areas (SF)	Remarks
Level, landscaped private areas	1,039,530	75% x {[Pad area] – [std home footprint][7] – [std driveway][8]}
Sloped private areas	2,201,671	[Gross lot size] – [pad area]
Common landscaped areas	1,950,000	From developer's 2016 landscaping plans
Mini Park	9,076	From 2016 developer's landscaping plan
Swimming Pool	~3,000	From developer's 2016 landscaping plans

Table 6. Various Unit Irrigation Demands

Landscaping Type	Feet / Year	Remarks
ETo[9] for Chatsworth, CA	5	Based on CIMIS Station 215, April 2016 - March 2017
LVMWD Std Water Budget Goal	4	80% of ETo based on SBx7-7
Parks	3.5	Based on analysis of 42 recycled water LVMWD accounts performed for the 2007 Master Plan
Golf Courses	3.5	
Common area slopes	2.6 – 2.8	
Medians/parkways	5.5	

[7] Standard home footprint = 2400 SF
[8] Standard driveway = 690 SF
[9] ETo for CIMIS Station 215 (Chatsworth), April 2016 - March 2017 is 60.09 inches

Both state law and local ordinances impose restrictions on what types of landscaping may be employed, including limits on the areas that may be planted in turf. As a new development, Deerlake Ranch must submit landscaping plans for plan check that comply with these requirements, but over time, individual property owners are not prevented from modifying the landscaping designs. It should be anticipated that many of the natural slope areas will eventually be planted and receive some amount of irrigation.

Estimated Outdoor Use

As noted earlier, a majority of LVMWD customers do not meet their water budget goals, and a substantial portion exceed their goals by 100% or more (i.e., consumption is 2 times the goal or more). In designing water facilities for this development, it needs to be assumed that water budgets here will be also be exceeded. Taking these factors into consideration, conservative estimates of irrigation quantities are as shown below.

Table 7. Estimated Outdoor Water Use

Land Use	Areas (SF)	Unit Demands	Acre-Ft / Yr	Gallons/Day
Level, landscaped private areas	1,039,530	5[10]	119	107,000[11]
Sloped private areas	2,201,671	1.3[12]	66	58,700
Common landscaped areas	1,950,000	2.5[13]	112	100,000
Mini Park	9,076	4[14]	1	750
Swimming Pool	3,000	6	0	350
TOTAL (rounded)				266,000
Total in gpm				**185**

Peaking Analysis

Figure 2 and Figure 3 show the general seasonal variations in demands for the Twin Lakes and Upper Twin Lakes zones. These graphs compare average monthly demands with average annual demands for the years 2010 through 2016, including pre-drought and drought conditions, and recession and post-recession periods. While the patterns are similar from year to year, variations in peak values are seen. No particular drivers for the variations are apparent: the peak values for 2010 and 2016 are very similar, although the weather and economic situations were different.

[10] Using budget exceedance figures, if (1) 40% use 4 ft (water budget); (2) 27% use 2 x 4 ft, and (3) 33% use 1.5 x 4 gpcd, the result is 5.7 feet. This has been rounded down to account for more drought-tolerant landscaping at Deerlake Ranch.
[11] This compares to an annual water budget of 85,000 gallons per day (80% of 5 feet, or 4 feet).
[12] Assumes 50% of these areas will eventually be landscaped and 2.6 feet of water will be applied per year.
[13] Based on 2.6-2.8 feet per year, from 2007 Master Plan, but factoring in more drought-tolerant plantings.
[14] 80% of ETo; assumes mostly turf.

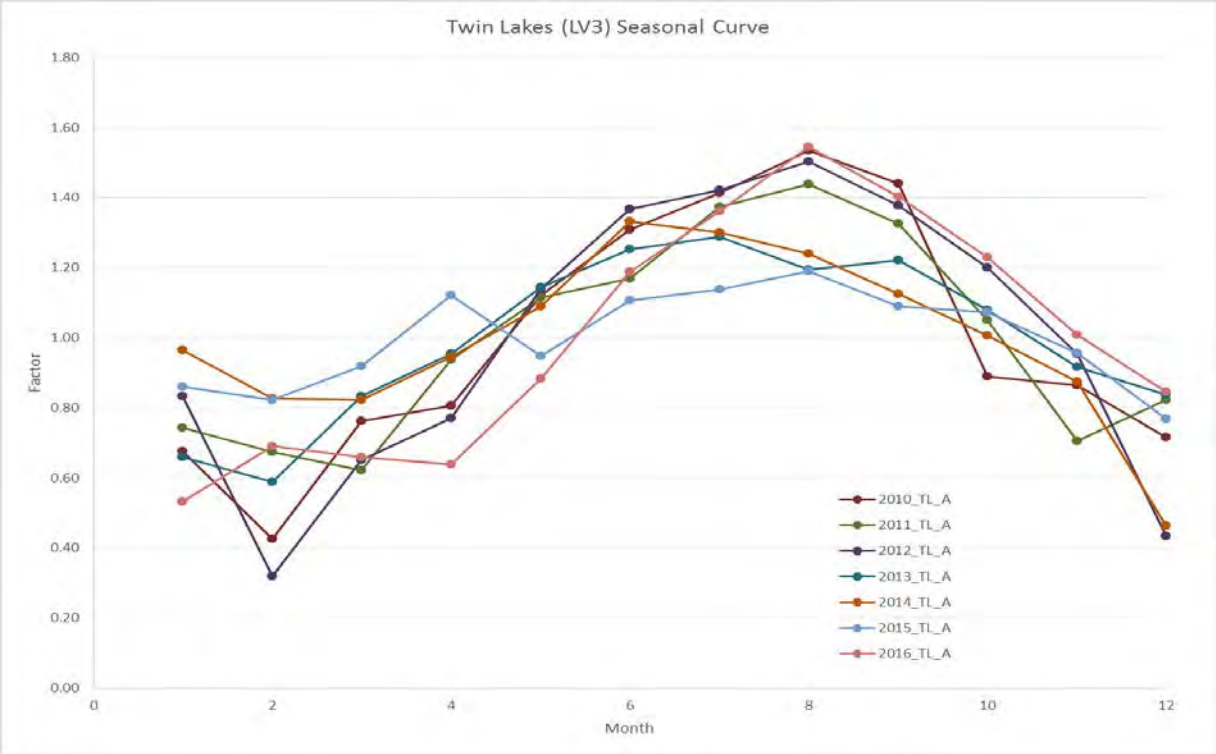

Figure 2. Seasonal Curve - Twin Lakes Subsystem

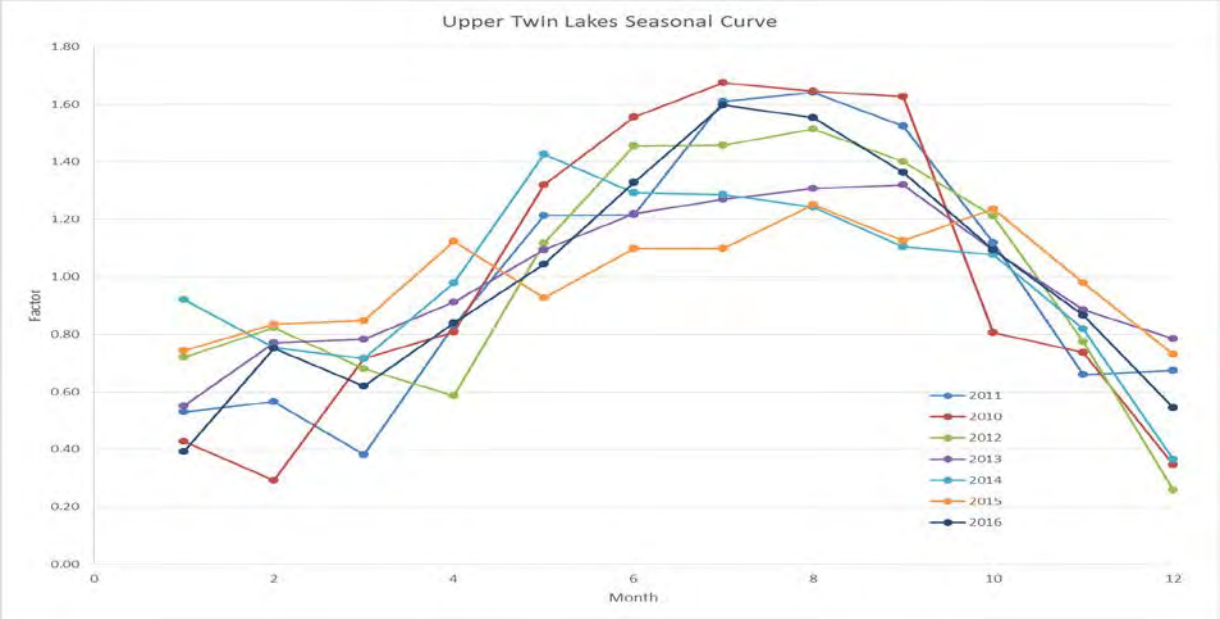

Figure 3. Seasonal Curve – Upper Twin Lakes Subsystem

Average Day Demand

Average day demand (ADD) is the volume of water consumed on the average day. For the Deerlake Ranch development, it is estimated to be the sum of the estimated indoor and outdoor usage as computed above.

Deerlake Ranch ADD = average indoor and outdoor use
= 52[15] + 185[16] = 240 gpm (rounded)

Maximum Day Demand

For sizing of pumping and storage facilities, the maximum daily demand (MDD) is important. The MDD peaking factor (PF) is the ratio of the volume of water used on the maximum demand day to the ADD. Table 8 shows calculations of the MDD PF for the last seven years for both the Twin Lakes and Upper Twin Lakes zones.

Table 8. Recent MDD, ADD, and MDD PF for Twin Lakes and Upper Twin Lakes Zones

	Twin Lakes System			Upper Twin Lakes System		
YEAR	MDD (gpm)	ADD (gpm)	MDD PF	MDD (gpm)	ADD (gpm)	MDD PF
2010	1187	321	3.7	196	90	2.2
2011	855	341	2.5	377	103	3.7
2012	1192	342	3.5	333	109	3.1
2013	1052	382	2.8	399	120	3.3
2014	891	366	2.4	353	116	3.0
2015	783	304	2.6	229	93	2.6
2016	783	337	2.3	237	93	2.6
DESIGN	1200	400	3.7	400	120	3.7

For its last two master plans, LVMWD has used a MDD PF of 3.2, based on calculations performed in 2007. For design of a new system, the MDD PF should be the highest that is reasonably expected to be experienced without a fire or other emergency. A MDD PF of 3.7 is therefore appropriate.

Deerlake Ranch MDD = MDD PF x ADD = 3.7 x 240 = 890 gpm

Peak Hour Demand

Similarly, the peak-hour demand (PHD) is important for the sizing of pipelines and other facilities that must handle instantaneous demands. The PHD is the maximum flow required on the peak hour of the maximum demand day. The PHD PF (as used in this analysis) is the ratio of this flow to the average flow for the year.

Table 9 shows calculations of the MDD PF for the last seven years for both Twin Lakes and Upper Twin Lakes pressure zones.

[15] From Table 4.
[16] From Table 7.

Table 9. Recent PHD Peaking Factors for Twin Lakes and Upper Twin Lakes Zones

YEAR	Twin Lakes System	Upper Twin Lakes System
2010	2.6	4.5
2011	n/a	4.1
2012	4.6	3.8
2013	n/a	3.7
2014	4.8	3.8
2015	3.6	4.2
2016	4.7	4.2

n/a = not available (poor data)

Figure 4 illustrates hourly peaking factors for Upper Twin Lakes, calculated from operational data (SCADA data) provided by the District. As expected, flows peak between 6AM and 7AM, and bottom out at mid-day. This figure also illustrates errors inherent in the calculations. The negative values are fictitious, produced when a tank level rise is recorded after the pump has shut down.

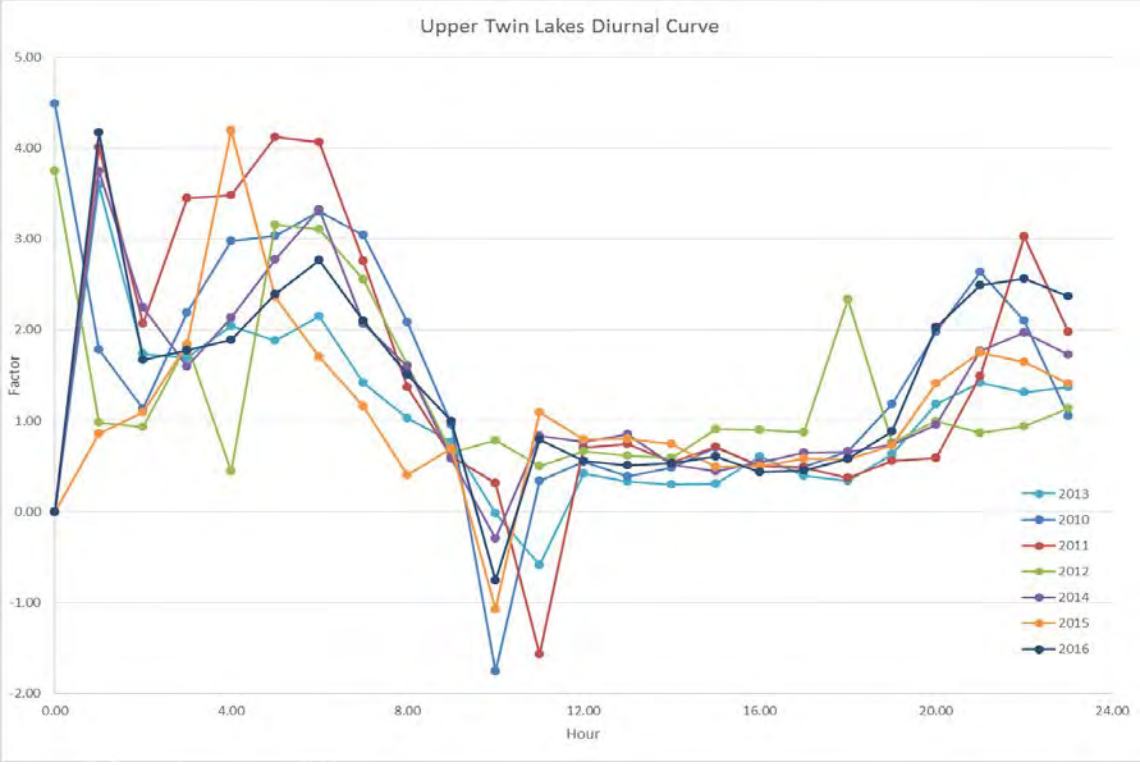

Figure 4. Hourly peaking factors for the Upper Twin Lakes Subsystem

For its last two master plans, LVMWD has used a PHD PF of 8.5, based on calculations performed in 2007.

For design of a new system, the MDD PF should be the highest that is reasonably expected to be experienced without a fire or other emergency. Therefore, a PHD PF of 5.0 is appropriate.

Deerlake Ranch PHD = PHD PF x ADD = 5 x 240 = 1200 gpm (rounded)

Summary of Results

Table 10 summarizes the estimated demands on the Twin Lake PS upon build-out of the Deerlake Ranch development.

Table 10. Analysis of Twin Lakes Pressure Zone Maximum Day Demands

	Flow rate (gpm)
Existing Twin Lakes Zone MDD	1200
Upper Twin Lake Zone MDD	400
Allowance for Undeveloped Lots in TL and UTL zones	50
Estimated Deerlake Ranch MDD	890
Total Demand on Twin Lakes PS	2540
Fire Flow (per Church of the Rocky Peak, record drawings, for 3 hours) [17]	3750

Pumping and storage facilities will need to be adequately sized to meet the above demands. In addition, pipelines will need to be sized to meet peak-hour demands within the zone of 1200 gpm.

Closure

Estimating water demands for Deerlake Ranch is inherently problematic since it involves predicting the future behavior of hundreds of future customers. Because these demands will be imposed on existing facilities, the ability to absorb these demands is very limited, so the estimates need to be both accurate and conservative.

Elsewhere in the LVMWD system, demands from new developments have exceeded estimates that were based on historical consumption data. In the cases of the Upper Twin Lakes and Upper Oaks systems, new pump stations serving these facilities were sized for demands that were less than what was ultimately experienced, but because these facilities had been designed for 9-hour pumping, they had significant capacity to absorb additional demands by extending operations for more than 9 hours. While the pumping time at Twin Lakes PS could be extended a little (from 18 hours to 24 hours), the added capacity is less substantial, and no margins for operational errors would exist.

Section 1: Introduction

Deerlake Ranch, Tract No. 53138, is a proposed development encompassing approximately 233 acres west of Porter Ranch and northeast of the Topanga Canyon Boulevard interchange with California Highway 118 (Ronald Reagan Freeway). The proposed development consists of 314 single-family residential lots, one recreation building, one sheriff facility, and 31 open space lots. Due to the large size of the development, Deerlake Ranch will be constructed in three phases.

Potable water will be delivered to Deerlake Ranch by the Las Virgenes Municipal Water District (District). Deerlake Ranch is situated within the District's Twin Lakes pressure zone. Water supply enters the pressure zone through the LV-3 turnout, which is an 8-inch connection to Metropolitan Water District of Southern California's West Valley Feeder No. 2. The Twin Lakes Pump Station adds approximately 530 feet of head to reach the Twin Lakes system hydraulic grade line of 1,585 feet. Twin Lakes also supplies water to the Upper Twin Lakes system via the Upper Twin Lakes Pump Station. Upper Twin Lakes has a hydraulic grade line of 1,805 feet. Features of both systems are presented in Table 1. Deerlake Ranch will be served by the Twin Lakes system, but one alternative involves adding a new reservoir and additional pumping/pressure reducing capacity to the Upper Twin Lakes system to satisfy the Deerlake demand (see Section 2).

Table 1: Twin Lakes and Upper Twin Lakes System Features

Feature	Twin Lakes	Upper Twin Lakes
Duty Pumps	3 x 100 hp 2 x 75 hp	1 x 40 hp
Standby Pumps	1 x 100 hp	1 x 40 hp
Nominal Flow	2,500 gpm	400 gpm
Standby Flow	585 gpm	400 gpm
Pump Station TDH	530 ft	240 ft
Storage	2.0 MG	0.385 MG
Reservoir High Water Level	1,585 ft	1,805 ft

Source: Kennedy/Jenks Consultants, Potable Water Master Plan Update 2014, dated 30 June 2014.

AECOM prepared a DRAFT Water System Design Report (Report) to evaluate the impact of Deerlake Ranch on the District's existing infrastructure. Phase 1 of Deerlake Ranch consists of 103 single-family units, Sheriff Station, Recreation Center, and 16.2 acres of landscape demands. Phase 2 consists of an additional 142 single-family units and 8.4 acres of landscape. Phase 3 consists of an additional 69 single-family units and 11.2 acres landscape. The findings of the Report are summarized in Table 2. Phase 1 can be supplied by the Twin Lakes system without any upgrades; however, Phases 2 and 3 require expansion of the Twin Lakes pumping and storage capacities.

Table 2: Deerlake Ranch Pumping and Storage Analysis by Construction Phase

Deerlake Ranch Phase	Twin Lakes Pumping Demand	Twin Lakes Pumping Surplus / (Deficit)	Twin Lakes Storage Demand	Twin Lakes Storage Surplus / (Deficit)
Phase 1	2,457 gpm	43 gpm	1.84 MG	0.16 MG
Phase 2	2,865 gpm	(365 gpm)	2.11 MG	(0.11 MG)
Phase 3	3,120 gpm	(620 gpm)	2.29 MG	(0.29 MG)

Source: AECOM, DRAFT Water System Design Report for Amended Vesting Tentative Track No. 53138 Deerlake Ranch, Dated 18 March 2016.

Construction of the entire Deerlake Ranch development will require an additional 620 gpm of pumping capacity and 0.29 MG of storage capacity to the Twin Lakes system. Concurrently, the District's Potable Water Master Plan Update 2014 identified pumping and storage deficits for year 2035 of 1,878 gpm and 1.5 MG, respectively, for the Twin Lakes system. Demands from Deerlake Ranch are included in the 2035 pumping and storage deficits identified in the Master Plan.

The primary objective of this study is to evaluate alternatives and recommend project(s) to add 620 gpm of pumping and 0.29 MG of storage capacity to the Twin Lakes System as a result of the deficit created by construction of the Deerlake Ranch development. A secondary objective is to identify opportunities for upsizing recommended project(s) that can advance the District toward meeting the 2035 pumping and storage deficits.

Section 2: Alternatives

2.1 Pumping

Three alternatives were evaluated to increase the pumping capacity in the Twin Lakes system to meet the needs of the Deerlake Ranch development.

2.1.1 Alternative P-1: Modifications at Twin Lakes Pump Station

The Twin Lakes Pump Station was expanded in anticipation of the Deerlake Ranch and Indian Hills developments (Boyle, 2004), with construction at the Pump Station completed in 2009. However, current demand projections through Phase 3 of Deerlake Ranch show the Twin Lakes Pump Station is deficient in pumping capacity. To overcome a deficit of 620 gpm due to Deerlake Ranch, two additional 75 hp pumps can be installed to provide an additional 430 gpm each, totaling 860 gpm for the pump station. The 2009 upgrades to the pump station included two flanged tees on the eastern outlet manifold in anticipation of installing additional pumps. The flanged tees were placed to accommodate future 100 hp pumps. Installation of larger pumps is not recommended since the maximum water velocity past the pump bowl would exceed 5 ft/s (Boyle, 2004). To allow for future expansion, the two new 75 hp pumps can be installed in pump cans sized for 100 hp pumps. A layout of the pump station is presented in Figure 1 of Appendix A with the two new pumps identified as P7 and P8 located on the east discharge manifold.

Twin Lakes Pump Station has a nominal capacity of 2,500 gpm; however, the pump station currently operates at a capacity of 1,600 gpm. This flow restriction is due to the 8-in suction pipeline connecting the District's turnout (LV-3) to the pump station. The District plans to install a parallel 14-in suction pipe to increase suction capacity, including emergency supply, to allow for a higher pumping output (AECOM, 2016).

An opportunity exists to add one additional 100 hp pump to the west discharge manifold. This manifold houses two 100 hp pumps, one 75 hp pump, and one standby 75 hp pump. In the Preliminary Design Report for the original Twin Lakes Pump Station Expansion, Boyle Engineering proposed installing two new pump cans north of the existing west discharge manifold. Space is available to install one new pump at this location. This new pump is shown as P9 in Figure 1 of Appendix A. With the three additional pumps, the maximum total water flow through the east discharge manifold is 2,030 gpm and through the west discharge manifold is 2,615 gpm. The new pump station rating would be 4,060 gpm, assuming one 100 hp pump is on standby. Under this plan, the District would only have a 433 gpm pumping deficit for 2035.

Additional pumps require increasing the capacity of the suction and discharge surge tanks. The suction surge tank has a capacity of 1930 gal and is rated for 350 psi, while the discharge surge tank has a capacity of 2500 gal and is rated for 500 psi. The discharge surge tank was installed as part of the pump station expansion in 2009, while the suction surge tank was installed with the original pump station construction in 1966. Pumps P7 and P8 will require a new suction surge tank to be installed upstream of the east manifold discharge. Pump P9 may also require replacement of the existing suction surge tank. The discharge surge tank was sized with pumps P7 and P8 included, so modifications to the discharge surge tank may not be required.

Evaluation of the existing surge tanks and sizing of new surge tank(s) requires a detailed surge analysis and design, which is beyond the scope of this study.

The Twin Lake Pump Station is supplied electricity through a 500 kilovolt-amp (kVA), 480 volt (V) utility transformer. This utility transformer is feeding an 800 amp (A) distribution switchboard (DSB) 103 that feeds a 600A motor control center (MCC) 103 and a 600A DSB 101. DSB 101 in turn feeds 600A MCC 101. Current electrical loads are shown in Table 3 and the tabulation is shown in Table 4. Assuming the worst case scenario where the 100 hp standby pump is in operation and the 75 hp pump is offline, the existing 500 kVA transformer is at 100 percent capacity and the loads on 600A MCC-101 and MCC-103 are at 79 percent and 47 percent, respectively, when tabulating the electrical loads with 25 percent extra load assigned to the largest motor.

Table 3: Twin Lakes Pump Station Electrical Loads

Load	Size (HP/kVA)	Status	Max Demand (kVA)	Max Demand (Amps)	Load on
P1	75 HP	Duty	80	96	MCC 101
P2	75 HP	Duty	80	96	MCC 101
P3	100 HP	Duty	103	124	MCC 101
P4	100 HP	Duty	103	124	MCC 101
P5	100 HP	Duty	103	124	MCC 103
P6	100 HP	Standby	103	124	MCC 103
Air Compressor	3 HP	Duty	4	4.8	MCC 103
Light Panel	3 kVA	Duty	3	6.25	MCC 101

Table 4: Twin Lakes Pump Station Electrical Load Tabulation

Load	Max Demand (kVA)	Max Demand (Amps)	Load Capacity (%)
Total Loading on 500 kVA XFMR[(a)]	499	603	100
Total Loading on MCC 101[(b)]	369	446.25	74
Total Loading on MCC 101 with 25% Extra of Largest Motor[(b)]	394.75	477.25	79
Total Loading on MCC 103[(c)]	210	252.8	42
Total Loading on MCC 103 with 25% Extra of Largest Motor[(c)]	235.75	283.8	47

Notes:
(a) Assumes P1 is offline and P6 is online.
(b) Assumes all loads on MCC 101 are online.
(c) Assumes all loads on MCC 103 are online.

Adding two additional pumps P7 and P8 to the eastern discharge manifold impacts the 500 kVA transformer, 600A DSB 103, and 600A MCC 103. Table 5 shows that P7 overloads the utility transformer. P7 and P8 overload the utility transformer and the feeder breaker to MCC 103. Adding pump P9 to the western discharge manifold further impacts the 500 kVA transformer,

600A DSB 103, and 600A MCC 101. It is assumed pumps P7 and P8 are installed before pump P9 as the eastern discharge manifold was constructed to accommodate two additional pumps. Table 5 and Table 6 show that P7, P8, and P9 overload the utility transformer and DSB 103. MCCs 101 and 103 are not overloaded with the additional pumps.

Table 5: Twin Lakes Pump Station Electrical Load with New Pumps P7 and P8

New Load on MCC 103	Size (hp)	Total Transformer Loading (kVA)	Total Transformer Loading (%)	MCC 103 Loading (Amps)	MCC 103 Loading (%)	DSB 103 Loading (Amps)	DSB 103 Loading (%)
P7	75	579	116	380	63	696	87
P7 & P8	150	659	132	476	79	793	99

Table 6: Twin Lakes Pump Station Electrical Load with New Pump P9

New Load on MCC 101	Size (hp)	Total Transformer Loading (kVA)	Total Transformer Loading (%)	MCC 101 Loading (Amps)	MCC 101 Loading (%)	DSB 103 Loading (Amps)	DSB 103 Loading (%)
P9	100	762	152	505	84	917	115

The 500 kVA utility transformer is fully loaded under current electrical loads. Adding one 75 hp pump (P7) on MCC 103 would require the utility transformer to be upgraded to 750 kVA. Adding two 75 hp pumps (P7 and P8) would also require upgrading the utility transformer to 750 kVA as well as upgrading feeder breaker to MCC 103. Adding two 75 hp pumps (P7 and P8) on MCC 103 and one 100 hp pump (P9) on MCC 101 require upgrading the transformer to 1,000 kVA, upgrading DSB 103 from 800A to 1000A, and upgrading the feeder breaker to MCC 103. Table 7 summarizes electrical upgrades at the Twin Lakes Pump Station for new pumps.

Table 7: Twin Lakes Pump Station Electrical Upgrades Required for New Pumps

Upgrade Required	P7	P7, P8	P7, P8, P9
Upsize Transformer from 500 kVA to 750 kVA	X	X	
Upsize Transformer from 500 kVA to 1,000 kVA			X
Upgrade DSB 103 from 800A to 1,000A			X
Upgrade Feeder Breaker to MCC 103 from 400AT to 500AT		X	X

2.1.2 Alternative P-2: Emergency Pump and Power at Twin Lakes Pump Station

To meet the required pumping capacity without permanently expanding the Twin Lakes Pump Station, an emergency pump and power trailer can be installed at the pump station. The pump would be an above grade vertical turbine pump with hard piping connections to the inlet and outlet pipe manifolds. Emergency power in the form of a trailer mounted generator would also

be required to power the pump. This setup allows the pump to operate as an emergency backup supply primarily to pump water for meeting the system-wide peak demand. The emergency pump can also supply water if power to the pump station is interrupted, allowing the District to continue pumping into the Twin Lakes system until the District's temporary emergency power trailer is brought to the site and put into operation.

A new pipe connection to the suction and discharge pipes is required to supply water to the temporary above grade pump. This requires excavation across the eastern portion of the pump station site, crossing existing water pipes and electrical conduits. The temporary power generator, assumed to be trailer mounted, will need to be exercised periodically to ensure proper operation. Operation of the temporary pump will require integration with SCADA. While a temporary pump may be viable to meet the Phase 2 demands, it is not a permanent solution. This alternative also requires permitting through the Air Quality Management District, increased maintenance for operations staff, development and executing of a testing schedule, and exposes the District to risk for maintaining a temporary pump and generator in perpetuity. Due to these reasons, this alternative is eliminated.

2.1.3 Alternative P-3: Modifications at Upper Twin Lakes Pump Station

The Upper Twin Lakes Pumping Station is equipped with two 40 hp pumps, each capable of providing 400 gpm of pumping capacity. One pump is operated as a duty pump and the other is reserved for standby, although the pump station and supporting infrastructure were sized to allow for both pumps to operate simultaneously for a total capacity of 800 gpm (Boyle, 2001). The connecting pipeline between the Upper Twin Lakes Pump Station and Tank is sized at 12 inches. A 6-inch PRV inside the pump station allows Upper Twin Lakes to supply emergency water to the Twin Lakes system. The PRV has a maximum suggested flow of 1,800 gpm and an intermittent maximum flow of 2,250 gpm. The CMU building housing the pumps and PRV was constructed on a small lot without space reserved for future expansion. Since Deerlake Ranch is within the Twin Lakes pressure zone, adding pumping capacity to the Upper Twin Lakes zone does not satisfy the 620 gpm pumping deficit in the Twin Lakes zone. Therefore, this alternative is eliminated.

2.2 Storage

Nine alternatives were evaluated to increase the storage capacity in the Twin Lakes system to meet the needs of the Deerlake Ranch development. The first alternative consists of replacing the existing 0.4 MG Twin Lakes Tank 1 with a 0.7 MG tank, the second consists of a new 0.3 MG Upper Twin Lakes Tank 2, and the remaining seven alternatives consist of new 0.3 MG tanks located within the Twin Lakes system.

2.2.1 Alternative S-1: Replace Twin Lakes Tank 1

Twin Lakes Tank 1 has a capacity of 0.4 MG. The bottom floor of Tank 1 is approximately six feet higher than the bottom floor of Tank 2. By re-grading the site around Tank 1 to match the bottom floor of Tank 2, a replacement 0.7 MG tank can be constructed with the same bottom floor and high water elevations to match Tank 2. The replacement 0.7 MG Tank 1 will have an

internal diameter of 63 feet, which is 10.5 feet larger than the existing 0.4 MG Tank 1. A preliminary layout of the replacement 0.7 MG Tank 1 is presented in Figure 2. To limit the amount of re-grading required for the replacement 0.7 MG Tank 1, the center of the tank can be shifted closer to Tank 2 while still maintaining a 15-ft wide access road around and between both tanks.

Purchasing additional land to accommodate the larger Tank 1 is not required, but a temporary easement is likely needed for construction. The District has a maintenance easement for the access road to the tank site. Since the easement does not allow improvements to the access road, no access road improvements are considered in this alternative. Visual impact of the new tank to the communities below is anticipated to be minimal since the new tank will have the same height as the original tank, although it will be 10.5 feet wider and 6 feet lower. Due to the significant grading required to lower the tank site by approximately six feet, retaining walls may be required and spoils must be hauled off-site through the Indian Hills neighborhood.

2.2.2 Alternative S-2: New Upper Twin Lakes Tank 2

The Upper Twin Lakes tank has a current capacity of 0.385 MG and resides on an oversized lot designed to support a temporary tank. The space reserved for the temporary tank is not large enough to construction a 0.3 MG tank with a 15-ft wide access road; however, by utilizing the temporary tank space and extending the property line, a 0.3 MG tank can be constructed at the site. Figure 3 shows a preliminary layout of the Upper Twin Lakes Tank site with the new 0.3 MG tank. The adjacent property owner is the Mountains Recreation and Conservation Authority (MRCA). A land purchase agreement or easement is required to construct the 0.3 MG tank. Visual impact of the new tank to the communities below is minimal since the tank is located behind a hillside. An existing storm drain pipeline will also need to be relocated to accommodate the new tank.

The 12-in pipeline currently serving the Upper Twin Lakes Tank can also serve the new 0.3 MG tank. At the District's maximum acceptable velocity of 10 feet per second (fps), approximately 3,500 gpm of water can flow down to the Upper Twin Lakes Pump Station. The limiting factor allowing flow from the Upper Twin Lakes system to the Twin Lakes system is the 6-in PRV, which has a maximum continuous flow of 1,800 gpm and an intermittent maximum flow of 2,250 gpm. A parallel pipe with an above grade PRV can be installed at the Upper Twin Lakes Pump Station to increase the amount of water that can flow from Upper Twin Lakes to Twin Lakes. The two booster pumps in the Upper Twin Lakes Pump Station have a combined supply of 800 gpm, which limits the rate at which the Upper Twin Lake Tanks can refill.

A summary of the existing Twin Lakes and Upper Twin Lakes tanks, along with the proposed tank at each site, is presented in Table 8.

Table 8: Summary of New and Proposed Storage Tanks at Existing Sites

Feature	Twin Lakes 1	Twin Lakes 2	Upper Twin Lakes 1	New Twin Lakes 1 (Alt. S-1)	New Upper Twin Lakes 2 (Alt. S-2)
Storage	0.4 MG	1.6 MG	0.385 MG	0.7 MG	0.3 MG
Internal Diameter	52'-6"	95'-0"	60'-0"	63'-0"	54'-0"
Reservoir High Water Level	1585 ft	1585 ft	1805 ft	1585 ft	1805 ft
Reservoir Bottom Floor	1561 ft	1555 ft	1787 ft	1555 ft	1787 ft

2.2.3 Alternative S-3: New Tank near Fern Ann Falls Rd

A new 0.3 MG tank can be constructed near Fern Ann Falls Road in the existing Indian Falls development with a bottom elevation of 1560 ft. This tank location, shown in Figures 4 and 5, requires the purchase of property from a private land owner. Access to the tank is via a private driveway, likely owned by the same property owner. The pipeline connection to the new tank would be off the existing 8-in pipeline in Fern Ann Falls Rd. Approximately 625 linear feet (LF) of 8-in pipe is required to reach the proposed tank. Since the property is owned by a private owner and the tank is located within the Indian Hills development, this alternative is eliminated.

2.2.4 Alternative S-4: New Tank near Johnson Mountain Way

A new 0.3 MG tank can be constructed near Johnson Mountain Way in the existing Indian Falls development with a bottom elevation of 1560 ft. This tank location, shown in Figures 4 and 5, requires the purchase of property from a private land owner. A new access road following a similar alignment of an existing dirt needs to be constructed. The pipeline connection to the new tank would be off the existing 12-in pipeline at the intersection of Ewana Place and Annepe Way. Approximately 675 LF of 8-in pipe is required to reach the proposed tank. Since the property is owned by a private owner and the tank is located within the Indian Hills development, this alternative is eliminated.

2.2.5 Alternative S-5: New Tank Northwest of Deerlake Ranch

A new 0.3 MG tank can be constructed northwest of Deerlake Ranch with a bottom elevation of 1560 ft. This tank location, shown in Figures 4 and 6, requires the purchase of property from a private land owner and easements from private owners and the MRCA for the pipeline. A new access road needs to be constructed. The pipeline connection to the new tank would be off a proposed 8-in pipe in the Deerlake Ranch development, on Schindler Way. Approximately 3,500 LF of 8-in pipe constructed through rolling hills is required to reach the proposed tank. Due to the long pipeline and the multiple property owners, this alternative is eliminated.

2.2.6 Alternative S-6: New Tank at Horse Rest Area

A new 0.3 MG tank can be constructed at the “Horse Rest Area” within the Deerlake Ranch development. This tank location, shown in Figures 4 and 6, does not require the purchase of property since the developer already owns the land. However, the bottom elevation of a tank proposed at this site is 1530 ft. In order to reach the high water elevation of 1585 ft, the tank

needs to be 55 ft tall or the site needs to be significantly built-up. Since the site does not meet the elevation requirements for a new storage tank within the Twin Lakes pressure zone, this alternative is eliminated.

2.2.7 Alternative S-7: New Tank at Mountain Peak North of Deerlake Ranch

This alternative considers a new 0.3 MG tank on a ridgeline north of Deerlake Ranch. The location is shown in Figures 4 and 6, and requires purchase of land from a private owner. Additional easements from private owners and MRCA are required for a supply pipeline and access road. Approximately 1,925 LF of 8-in pipe from the tank will follow the access road and connect to the proposed 8-in pipe within Deerlake Ranch on Canoga Avenue. The bottom elevation of the tank is 1670 ft, well above the targeted elevation of 1560 ft. To reach the elevation of 1670 ft, a booster pump station needs to be constructed near the 1570 ft elevation to pump the water to the new tank. A PRV also needs to be installed to reduce the head of the water down to 1585 ft to enter the Twin Lakes pressure zone (similar to alternative S-2). Since alternative S-2 has preferable existing conditions including an existing pump station, PRV, and partially graded site, this alternative is eliminated.

2.2.8 Alternative S-8: New Tank Beyond Mountain Peak North of Deerlake Ranch

A new 0.3 MG tank can be constructed north of Deerlake Ranch, beyond the ridgeline, with a bottom elevation of 1560 ft. This tank location, shown in Figures 4 and 6, requires the purchase of property from MRCA for the tank and an easement from MRCA for the connecting pipeline. The 8-in pipe is 1,925 LF with the majority of the pipeline following an existing trail. Since the tank is located behind the ridgeline, there is no visual impact to the Deerlake Ranch community. However, since the entire pipeline and tank are located within MRCA property, this alternative is eliminated.

2.2.9 Alternative S-9: New Tank Northwest of Unit 205 at Deerlake Ranch Property Boundary

This alternative considers a new 0.3 MG tank at the northern border of Deerlake ranch, northwest of Unit 205. This tank location, shown in Figures 4 and 6, requires property within Deerlake Ranch to be dedicated to the District. A draft layout of the tank was created by the developer and is attached as Appendix B. Extensive grading is required to build up a site large enough to house a tank that is approximately 30 ft in height and 50 ft in diameter; however, the grading work is not part of the tank construction since it would be conducted by the developer as part of the Deerlake Ranch construction. Retaining walls ranging from 1-ft to 25-ft tall are required. A new access road is to be constructed between units 203 and 204, with slopes ranging from 15 to 18.5 percent. A temporary grading easement with MRCA has already been granted to the developer for soil work in this area, so additional permitting is not anticipated at this time, assuming the final design of the tank and access road are entirely within Deerlake Ranch's development limits. Approximately 675 LF of 8-in pipe is required to reach the tank, with the pipe connection in Canoga Avenue.

Visual impact is high as the tank will be fully visible by the community below. If additional land is acquired from MRCA, the tank can be shifted north and landscaping can be planted to limit the visual impact. MRCA may be more willing to sell additional land for the tank construction if the tank access road is allowed to be used as a horse trail connecting an existing horse trail near the tank with Canoga Avenue. Through negotiations with MRCA, it may be possible to move the tank location north further onto MRCA property. This move allows the slope of the access road and the retaining wall heights to be reduced, which can result in significant cost savings.

Section 3: Evaluation of Alternatives

3.1 Evaluation of Pumping Alternatives

Deerlake Ranch requires an additional pumping capacity in the Twin Lakes system of 365 gpm for Phase 2 and an additional 620 gpm for Phases 2 and 3 (365 gpm for Phase 2 and 255 gpm for Phase 3). Alternatives P-1 and P-2 involve modifications and/or additions to the Twin Lakes Pump Station, whereas alternative P-3 considers modifications to the Upper Twin Lakes Pump Station. Since the supply to Upper Twin Lakes Pump Station is the Twin Lakes system, adding pumping capacity to the Upper Twin Lakes system only exacerbates the pumping shortage in the Twin Lakes system. Therefore, Alternative P-3 is not a viable option.

Alternative P-1 includes the addition of up to two 75 hp and one 100 hp pumps at the Twin Lakes Pump Station. The east discharge manifold has two flanged outlets in anticipation of additional pumps sized for 100 hp. Adding one 75 hp pump will meet the Phase 2 demands and adding an additional 75 hp pump will meet the Phase 3 demands, although the pumps should be installed in pump cans sized for 100 hp pumps to allow the District to upsize the pumps in the future. It is more cost effective and less interruptive to operations at the pump station to install both pumps at one time to meet the entire Deerlake Ranch demands. A separate study of the suction and discharge surge tanks will need to be undertaken to evaluate the adequacy of the tanks; however, it appears that the 2,500 gallon discharge surge tank is adequately sized since it was installed during the previous pump station expansion which was designed while considering the future impact of adding two more pumps. Adding two pumps will require upgrading the 500 kVA transformer to 750 kVA and the distribution switchboard from 800 A to 1,000 A.

Alternatives P-2 and P-3 were eliminated due to fatal flaws discussed in the previous section.

3.2 Evaluation of Storage Alternatives

Nine storage alternatives were considered in this study. S-1 involved replacing the existing 0.4 MG Twin Lakes Tank 1 with a 0.7 MG tank, S-2 consisted of a new 0.3 MG Upper Twin Lakes Tank 2, and Alternatives S-3 through S-9 evaluated locations for a new 0.3 MG tank at a site not currently owned by the District. Alternatives S-3 through S-8 had fatal flaws that resulted in their elimination from consideration as described in Section 2.2. As a result, only Alternatives S-1, S-2 and S-9 are considered further. To determine which storage alternative is preferable, an evaluation matrix is presented in Table 9.

Table 9: Storage Evaluation Matrix

Evaluation Criteria	S-1	S-2	S-9
Visual Impact	+	+	-
Ease of Construction	-	-	+
Acquisition of Additional Property	+	-	0
Ease of Operations	+	-	0
Service Interruptions / Impacts	-	+	+
Distribution System Reliability	-	-	+
Upgrades to Adjacent Infrastructure	+	0	0
Overall Assessment	**+2**	**-2**	**+2**

The storage alternatives are evaluated with a '+', '-', or '0' system. Alternatives considered advantageous for the criterion receive a '+' while alternatives that are disadvantageous receive a '-' score and neutral receive a '0' score.

- Visual Impact: Storage alternatives with minimal aesthetic impacts to the nearby communities receive a positive score.
- Ease of Construction: Minimal construction work receives a positive score.
- Acquisition of Additional Property: Alternatives that do not require additional acquisition receive a positive score.
- Ease of Operations: Alternatives that have minimal impact on the existing system operations receive a positive score.
- Service Interruptions / Impacts: Minimal service interruptions during construction receive a positive score.
- Distribution System Reliability: Increased redundancy receives a positive score.
- Upgrades to Adjacent Infrastructure: Alternatives that do not require upsizing upstream pipes or pumps receive a positive score.

Based on these criteria, storage alternatives S-1 and S-9 are preferred. Alternative S-1 received a high score since the visual impact of a replacement tank is negligible, a replacement tank can be constructed within the existing property limits, system operations will be unchanged, and the supply pipeline appears to be sufficient for the larger tank. Hydraulic modeling is needed to confirm additional flow to the larger tank meets the requirements outlined in the Master Plan for existing piping, which is beyond the scope of this report. The cons to this alternative are the significant grading required through hard rock anticipated to be encountered during excavation, the site is relatively tight for construction, the District will be without 0.4 MG of storage during construction, spoil materials must be hauled out through the Indian Hills development, and the tank does not improve distribution system reliability.

The other preferred alternative is S-9. Alternative S-9 has the highest ease of construction since the developer will perform the site grading leaving a level pad for constructing the new

tank. Additionally, service interruptions will be negligible since the existing system will not be affected while the tank is under construction. The reliability of the system is also increased since the new tank will be located a different area of the zone where if a water main break occurs on the supply pipeline feeding Twin Lakes Tanks 1 and 2, the new tank with Alternative S-9 will continue to provide water supply. However, the alternative will have a visual impact to the Deerlake Ranch community, may require property acquisition from MRCA, requires the District to operate and maintain a third tank in the Twin Lakes system, and may require upgrades to the existing 8-in supply pipelines northeast of Highway 118. Hydraulic modeling is needed to confirm that additional flow to the new tank meets the requirements outlined in the Master Plan, which is beyond the scope of this report.

Alternative S-2 is not a preferred alternative. While it has a negligible impact since the new tank will be constructed adjacent to the existing tank, has minimal service interruptions, and does not require an upgrade to the supply pipeline or pump station, the site is tight for construction, additional property must be acquired from MRCA, and the District's system operational strategy may need to change to account for water storage in a higher pressure zone. Pumping to a higher pressure zone results in added electricity cost to operate the pump, maintenance cost for pump and PRV upkeep, and it operates the system inefficiently. This alternative may be suitable for a temporary solution, but the permanent loss of a standby pump is unacceptable to the District. This alternative is eliminated.

3.3 Capital and O&M Costs

The capital cost for a new above grade welded steel tank is dependent on the size of the tank. Smaller tanks have a higher unit cost, expressed as a cost per gallon, than larger tanks. Fixed fees such as mobilization are spread over a larger tank volume and materials are more efficient on a structure to volume basis. For the purposes of this study, a unit cost of $1.05 per gallon is used for 0.3 MG tanks and $0.85 is used for 0.7 MG tanks. These unit costs include excavation for the ring wall footing, construction of the ring wall, fabrication and erection of the welded steel tank, coating of the interior and exterior of the tank, and tank appurtenances including but not limited to inlet and outlet piping connections, overflow piping, ventilation, measurement instrumentation, and mixing equipment.

Similarly to welded steel tanks, pump stations are also expressed as a unit cost per horsepower. A unit cost of $1,750 per horsepower is used for new pumps. This unit cost includes excavation for the new pump can, procurement and installation of the pump and motor, suction and discharge piping, two butterfly valves, control valve, pressure transmitter, and site repaving. Pump electrical panel and related cable runs are additional. Electrical supply upgrades such as a larger transformer and larger switchgear, if applicable, are estimated separately and in addition to the $1,750 per horsepower unit cost.

Welded steel storage tanks require operation and maintenance (O&M) costs after the initial capital expenditure. Every ten to fifteen years the interior and exterior coating of the tank needs to be removed and recoated to prevent corrosion of the steel. Operations staff also have costs associated with valve and equipment maintenance. O&M costs are assumed to be 2 percent of the initial capital cost per year.

Pump O&M requires servicing the pump and rebuilding the pump components every ten to fifteen years. Energy costs are also included in O&M costs. This study assumes 2 percent of the initial capital costs per year are required for O&M and 14.5 cents per kilowatt hour ($0.145/kWh) for energy costs.

Based on the above assumptions, a conceptual opinion of probable construction cost was developed for pumping alternative P-1 and storage alternatives S-1 and S-9. The opinion of probable construction cost is a Class 5 estimate in accordance with American Association of Cost Engineers. A Class 5 estimate contains an assumed accuracy of +50% to -30% of the actual cost of the alternatives. O&M and energy costs are included in the analysis for a 30 year period, in which the future annual costs are calculated in present value dollars. A summary of the estimated project lifecycle costs for each alternative is presented in Table 10 and the detailed capital cost estimate is attached as Appendix C.

Table 10: Pumping and Storage Cost Evaluation

Cost	P-1	S-1	S-9
Capital Cost	$465,000	$1,656,000	$1,724,000[(a)]
Tank O&M Cost	$0	$150,000[(b)]	$170,000
Pump O&M Cost	$214,000	$0	$0
Pump Energy Cost	$275,000	$0	$0
Total	**$954,000**	**$1,806,000**	**$1,894,000**

Notes:
(a) Alternative S-9 includes a cost of $1,200,000 for retaining wall construction related to the tank construction. Moving the tank to the north and refining the design may reduce the cost of grading, reducing the overall cost.
(b) Tank O&M cost for alternative S-1 reflects only the net increase in O&M for the 0.7 MG tank in lieu of the existing 0.4 MG tank.

As shown in Table 10, alternatives S-1 and S-9 are nearly equal in cost. Alternative S-2 requires significant grading required to lower the existing Twin Lakes Tank 1 site by 6 ft. Over 1,400 cubic yards (CY) of grading is required at a cost of $700 per CY. Alternative S-9 requires two retaining walls. One wall is approximately 130 ft long with heights ranging from 1 ft to 7 ft, and the other wall is approximately 400 ft long with heights ranging from 5 ft to 25 ft. While the grading costs for this alternative will be borne by the developer, the costs of the retaining walls push the overall cost higher than the other alternatives. If additional land is acquired from MRCA, the tank can be moved further north which reduces the extent of retaining walls required and lowers the overall cost of the alternative.

O&M costs were calculated per the assumptions stated previously and projected over a 30 year planning horizon. Annual inflation was assumed to be 2 percent and the discount rate was assumed to be 2.84 percent based on the 2015 average nominal rate of a 30 year U.S. Treasury note.

Section 4: Conclusion

Based on the evaluation in the previous section, this reviews preferred projects to meet Deerlake Phase 2 and Phase 3 demands, as well as identify any opportunities for meeting the Twin Lakes 2035 demands.

4.1 Meeting Deerlake Phase 2 Demands

Deerlake Phase 2 requires 365 gpm of pumping capacity and 0.11 MG of storage capacity to be added to the Twin Lakes system. To meet the 365 gpm pumping shortfall, one 75 hp pump can be installed at the Twin Lakes Pump Station to provide 430 gpm of pumping capacity. This requires upgrading the transformer, as described in Section 2.1.1. An analysis of the suction and discharge surge tanks is also suggested.

To meet the 0.11 MG storage shortfall, it may be possible to use the Upper Twin Lakes Tank as supplemental storage for the Twin Lakes system since the 2014 Master Plan identified a 0.15 MG existing storage surplus in the tank. An existing 6-in PRV connection between the Upper Twin Lakes and Twin Lakes zones allows water to move downgradient to the 1585 ft HGL. To confirm this excess storage volume, SCADA data from 01 June 2015 through 30 June 2016 for daily tank minimum and maximum levels were analyzed. After removing data outliers that showed a minimum tank level of 0 ft, the average minimum tank level was 8.94 ft and the average maximum tank level was 14.26 ft. This amounts to 112,500 gal of daily water use. The Master Plan defines storage as being composed of three components: fire, emergency, and daily operational storage. The required fire and emergency storage for the Upper Twin Lakes system is 150,000 gal and 18,000 gal, respectively. Table 11 details the volume calculations for using the Upper Twin Lakes Tank to meet the storage requirements for Deerlake Phase 2.

Table 11: Upper Twin Lakes Tank Storage Analysis

Value	Volume (gal)
Fire Storage	150,000
Emergency Storage	18,000
Daily Operational Storage	112,500
Total Required	**280,500**
Tank Capacity	**385,000**
Available	104,500
Deerlake Phase 2	110,000
Deficit	**-5,500**

As shown in Table 11, the Upper Twin Lakes Tank is not large enough to meet the storage requirement for Deerlake Phase 2. While a temporary 10,000 gal Baker Tank could be installed adjacent to the tank to allow for temporary additional storage, this is not advisable. In addition to requiring the District to modify its current operations to accommodate the temporary tank, the daily operational storage required for the Upper Twin Lakes Zone is variable. The current daily operational storage is at its lowest level in years due to drought restrictions. With the loosening

of the drought restrictions, demand and the corresponding daily operational storage will increase. Therefore the excess storage currently at Upper Twin Lakes Tank is not a reliable source for future storage. To meet Deerlake Phase 2 storage demand, a permanent storage alternative (S-1 or S-9) should be constructed.

4.2 Meeting Deerlake Phase 2 and 3 Demands

Deerlake Phases 2 and 3 require a total of 620 gpm of pumping capacity and 0.29 MG of storage capacity to be added to the Twin Lakes system. To satisfy the pumping shortfall, an additional 75 hp pump can be installed in a pump can sized for 100 hp at the Twin Lakes Pump Station. Installing the pumps in oversized pump cans allows the District to replace the 75 hp pumps in the future with 100 hp pumps. Since both Phase 2 and Phase 3 require an additional pump, the combined pumping capacity of two 75 hp pumps totals 860 gpm. The two pumps require an upgraded electrical transformer and feeder breaker, as described in Section 2.1.1. An analysis of the suction and discharge surge tanks is also suggested.

To meet the 0.29 MG of storage deficit, the existing 0.4 MG Twin Lakes Tank 1 can be replaced with a new 0.7 MG tank, a new 0.3 MG Upper Twin Lakes Tank 2 can be constructed, a new 0.3 MG tank within Deerlake Ranch can be constructed. An evaluation of the storage alternatives summarized in Table 9 determined replacing the Twin Lakes Tank 1 or constructing a new 0.3 MG tank within Deerlake Ranch to be the preferred alternatives. This cost difference between the two alternatives may change after incorporating the cost of land acquisition from MRCA and potential redesign of Alternative S-9 to reduce the retaining walls. Hydraulic modeling should be performed to evaluate the impact of the new tank on the existing distribution piping.

4.3 Meeting Twin Lakes 2035 Demands

The 2014 Master Plan Update identified a 1,878 gpm pumping deficit and 1.5 MG storage deficit in the Twin Lakes zone. Replacing 75 hp pumps P7 and P8 with 100 hp pumps will provide a total pumping supply of 1,170 gpm. Figure 1 shows an additional pump, P-9, which can be added to the west discharge manifold to provide an additional 585 gpm, bringing the total up to 1,755 gpm. Other modifications to the pump station can be undertaken to increase the suction pipe capacity to allow for larger pumps to be installed in order to meet the required 1,878 gpm of pumping capacity required. A detailed evaluation of the existing pump station will need to be undertaken to determine how much the pump station can be expanded and at what cost.

To meet the 1.5 MG storage deficit, which will be 1.2 MG after constructing the storage required for Phase 3 of Deerlake Ranch, the District can elect to construct a larger Twin Lakes Tank 1, a larger Deerlake Ranch tank, or pursue other storage alternatives identified in this report. Constructing Alternative S-9 first allows the District to delay construction of Alternative S-1 until it is needed. If Alternative S-1 is constructed and Alternative S-9 delayed, Alternative S-9 may not be viable for construction in the future after the Deerlake Ranch is developed. A detailed evaluation of each storage alternative and the resulting impact on the system will need to be conducted.

Exhibit 9	LVMWD Will serve Letter (1/5/16)

I. INTRODUCTION/PROJECT DESCRIPTION

The purpose of this sewer area study is to determine the amount of sewage flow generated by the tract development using the Los Angeles County area study standard. TR 53138 is located in the unincorporated Chatsworth area of the County of Los Angeles north of the Ronald Reagan Freeway, between Canoga Avenue and Topanga Canyon Blvd. Sewage flows from this tract are discharged into the City of Los Angeles sewer systems. A separate Sewer Area Study was prepared per City of Los Angeles Standards to determine the adequacy of the existing sewer system. That Sewer Area Study was reviewed and approved by the City of Los Angeles on June 18, 2015. Sewage flows from this tract are discharged at two locations into the City of Los Angeles Sewer System. One point of discharge is Outlet Point No. 1 (intersection of Topanga Canyon Blvd and Poema Place), and the other point of discharge is at Outlet Point No. 2 (Canoga Avenue, south of Ronald Reagan Freeway). Discharge to Outlet Point No. 2 (Canoga Avenue Sewer System) was conditionally approved by the City of Los Angeles based on the offsite construction of an 8-inch sewer along Canoga Avenue from Candice Pl to Celtic St per the previously approved sewer study Report as stated in a letter dated June 18, 2015 (see Exhibit 8). Offsite requirement from the City of Los Angeles can be seen in Exhibit 1 page 2, and will be per separate permit through the City of Los Angeles. A will serve letter from LVMWD is included (see Exhibit 9).

This tract development (TR 53138) was included in and part of the approved Sewer Area Study for TR 53235 (PC #11834AS). A copy of this approved study is included for reference. Tributary areas to the North and West of Connection Point 1 were shown and included in PC #11834AS. SEA areas and zoning of these offsite areas remain consistent today as when this approval was made. The total outlet flows at Connection Point 1 will be slightly less than the flow previously approved since the number of lots contributing from this project (TR 53138) at Connection Point 1 have been reduced from 31 lots to 17 lots.

The proposed project, TR 53138, consists of a possible 325 residential lots, a recreation center, a sheriff substation, and 29 open space lots (which include a pocket park, a horse rest area, and a helispot). The onsite sewer system is all gravity flow. A portion of the sewer mainline from Poema Place to Canoga Avenue runs across slopes and through an 8’ wide multi-use trail per approval of LA County Sewer Maintenance District to eliminate the need of any sewer lift stations.

II. SEWER PIPE CAPACITY ANALYSIS

Sewer Pipe Capacity Analysis for Tract No 53138 Outlet Point No. 1

Sewage flows were calculated per County Standard using flow coefficient of 0.0012 cfs/unit or lot per direction from the County Engineers. The results are as follows:

The tabulated comparisons between the County and City methodologies are as follows:

Q = 0.61 cfs…….County Standard

Q = 0.71 cfs…….City Standard

The preceding tabulation shows that at Outlet Point No. 1, the city standard has a higher value than the county standard, therefore, the existing sewer systems are adequate.

This Sewer Area Study also includes sewage discharged from the Twin Lakes community shown in Area 12 & Area 15 in the enclosed map (see Exhibit 1).

The total unit/lot count north of Poema Place and west of Topanga Canyon Blvd per approved PC#11834AS and based on the County of Los Angeles Consolidated S.M.D map S-1224 (see Exhibit 5) is as tabulated below:

West of Topanga Cyn Blvd:

Tract 34108----------58 Units

Tract 44334----------202 Units

Tract 44327----------33 Lots

Tract 44335----------20 Units

Tract 33622----------18 Lots

Tract 42353----------57 Lots

Tract 53235----------65 Units

Non-Tract Property----------10 Lots

Subtotal----------463 Units/Lots

NOTE: Any future subdivision in these offsite properties is subject to provide an updated sewer area study.

East of Topanga Cyn Blvd:

Area 11----------17 Lots

Area 12, 15 & Sheriff --32 Lots [Twin Lakes, Sheriff (Office 1200sf = .0009 cfs -see calc)]

Subtotal----------49 Lots

TOTAL Unit/Lot count = 463 + 49 = 512 Units/Lots

The revised flow to Outlet No. 1 for **County** of Los Angeles Standard is:

Q = .0012 cfs (peak) x 512 units/lots = **0.61 cfs (peak)**

The revised flow to Outlet No. 1 for **City** of Los Angeles Standard is:

Q = 4 persons/lot x 512 lots x 90gpcd x 1.5472×10^{-6} cfs/gpd = 0.285 cfs (ave)

0.285 cfs x 2.5 (peak factor) + Sheriff = **0.71 cfs (peak)**

Sewer Pipe Capacity Analysis for Tract No 53138 Outlet Point No. 2

Sewage flows were calculated per County Standard using flow coefficient of 0.0012 cfs/unit or lot per direction from the County Engineers.

The tabulated comparisons between the County and City methodologies are as follows:

Q = 0.63 cfs…….County Standard

Q = 0.73 cfs…….City Standard

The preceding tabulation shows that at Outlet Point No. 2, the city standard has a higher value than the county standard. Since analysis downstream of these outlet points were done using the City standard, therefore the existing sewer systems are adequate provided that the recommendations in the City of Los Angeles approved Sewer Area Study are implemented.

This study takes into consideration 40 acres of undeveloped land directly to the North of said project in A-2-2 zoning equaling 20 potential lots. The Santa Monica Mountains Conservancy (SMMC) owns a 10' strip immediately to the north of the entire project boundary and over half of another 40 acres directly west of the previously mentioned 40-acres.. The ≤20 acres north of this line that is owned by private owners is included per zoning (A-2-2, 10 lots) in the event that this area is allowed to be developed in the future.

Area 1 includes the potential 10 offsite lots mentioned above, and Area 4 includes the 20 potential offsite lots mentioned above. All "Not A Part" (NAP) potential lots (per VTTM 53138) within the tract were included in this study and added to their respective areas. Area 8 includes one offsite lot that was included in the flow calculations (see Exhibit 1).

This Sewer Area Study also includes sewage discharge from the Twin Lakes Community as shown on the enclosed map (see Exhibit 1).

Areas upstream of Connection Point 2:

Area 1----------24 Lots (14 + 10 Offsite per zoning)
Area 2----------18 Lots
Area 3----------31 Lots
Area 4----------55 Lots (35 + 20 Offsite per zoning)
Area 5----------94 Lots
Area 6----------28 Lots
Area 7----------23 Lots + Rec Ctr (Auditorium 60 cap = .001cfs -see calc.)
Area 8----------59 Lots (58 + 1 Offsite)
Area 9----------4 Lots
Area 10----------2 Lots
Area 13----------157 Lots (130 + 27 per zoning)
Area 14----------31 Lots

TOTAL Unit/Lot count = 526 Units/Lots + Rec Ctr

The revised flow to Outlet No. 2 for **County** of Los Angeles Standard is:

Q = .0012 cfs (peak) x 526 units/lots + Rec Ctr = **0.63 cfs (peak)**

The revised flow to Outlet No. 2 for **City** of Los Angeles Standard is:

Q = 4 persons/lot x 526 lots x 90gpcd x 1.5472×10^{-6} cfs/gpd = 0.293 cfs (ave)

0.293 cfs x 2.5 (peak factor) + Rec Ctr = **0.73 cfs (peak)**

III. EXISTING SEWER SYSTEM DESCRIPTION

See attached LA City Sewer Area Study.

IV. CONCLUSION

Subsequent capacity calculations of pipes downstream showed the existing system is adequate to handle the additional flows.

In regards to the outlet approval, a letter dated June 18, 2015 from Mr. Ali Poosti, Division Manager, Wastewater Engineering Services Division, LA Sanitation states that there is sufficient capacity for the City of Los Angeles to accept the flows of this project with the construction of an 8-inch sewer along Canoga Avenue from Candice Pl to Celtic St. (See Exhibit 8).

SEWER AREA STUDY FLOW CALCULATIONS

TRACT 53138

FLOW COEFFICIENT = 0.0012 CFS/UNIT OR LOT

AREA 1 : 24 LOTS (14 + 10 OFFSITE) ON SCHINDLER WAY @ SULLIVAN WAY

Mr. Matthew Sawyer, Project Engineer
UNITED CIVIL INC
30141 Agoura Road, Suite 215
Agoura Hills, CA 91301

Dear Mr. Sawyer:

DEERLAKE TRACT 53138 LOS ANGELES COUNTY-REQUEST FOR WASTEWATER SERVICE INFORMATION

This is in response to your April 14, 2015 letter requesting a review of your proposed mixed-use project which resides within the Las Virgenes Municipal Water District boundary for sewer and water service but then connects to the City of Los Angeles sewer systems at the north end of Canoga Ave and Topanga Canyon Blvd, Los Angeles, CA 91311. LA Sanitation has conducted a preliminary evaluation of the potential impacts to the wastewater and stormwater systems for the proposed project.

WASTEWATER REQUIREMENT

LA Sanitation, Wastewater Engineering Services Division (WESD) is charged with the task of evaluating the local sewer conditions and to determine if available wastewater capacity exists for future developments. The evaluation will determine cumulative sewer impacts and guide the planning process for any future sewer improvements projects needed to provide future capacity as the City grows and develops.

Projected Wastewater Discharges for the Proposed Project:

Type Description	Average Daily Flow per Type Description (GPD/UNIT)	Proposed No. of Units	Average Daily Flow (GPD)
Proposed: Point (1)			
Residential: 3-BDRMS	230/ DU	30	6,900
Residential: 4-BDRMS	275/ DU	17	4,675
Sheriff Station	120 GPD/1000 SQ.FT	1,100 SQ.FT	132
Total			**11,707**
Proposed: Point (2)			
Residential: 3-BDRMS	230/ DU	217	49,910
Residential: 4-BDRMS	275/ DU	165	45,375

Residential: 5-BDRMS	320/ DU	65	20,800
Residential: 6-BDRMS	365/ DU	70	25,550
Recreation Center	200 GPD/1000 SQ.FT	4,340 SQ.FT	868
Total			**142,503**
Net Total			**154,210**

SEWER AVAILABILITY

The sewer infrastructure in the vicinity of the proposed project includes two (2) discharge routes. Discharge Route (1) starts with an existing 10-inch line on Topanga Canyon Blvd for Point (1). The flow from the 10-inch line on Topanga Canyon Blvd passes into an 18-inch line on Shoup Ave before feeding into the 21-inch line on Topanga Canyon Blvd. Discharge Route (2) starts with an existing 8-inch line on Canoga Ave for Point (2). The flow from the 8-inch line on Canoga Ave passes into an 18-inch line on Topanga Canyon Blvd and then to another 18-inch line on Nordhoff St. On Canoga Ave the flow from the 21-inch line on Topanga Canyon Blvd from Point (1) join the flow from the 18-inch line on Nordhoff St from Point (2) to feed a 24-inch line before discharging into a 30-inch sewer line on Roscoe Blvd. Figure 1 shows the details of the sewer system within the vicinity of the project. The current flow level (d/D) in some of the lines cannot be determined at this time without additional gauging.

The current approximate flow level (d/D) and the design capacities at d/D of 50% in the sewer system are as follows:

Pipe Diameter (in)	Pipe Location	Current Gauging d/D (%)	50% Design Capacity
Point (1) Route			
10	Topanga Canyon Blvd.	*	1.63 MGD
18	Shoup Ave.	24	2.67 MGD
21	Topanga Canyon Blvd.	20	2.93 MGD
Point (2) Route			
8	Canoga Ave.	*	978,324 GPD
8	Eton Ave.	18	397,199 GPD
10	Canoga Ave.	24	509,236 GPD
18	Topanga Canyon Blvd.	28	1.84 MGD
18	Nordhoff St.	27	2.18 MGD
Point (1) & Point (2)			
24	Canoga Ave.	25	6.07 MGD
30	Roscoe Blvd.	32	6.74 MGD
30	Roscoe Blvd.	38	6.74 MGD

* No gauging available

Based on the estimated flows, it appears the sewer system might be able to accommodate the total flow for your proposed project based on the following;

- Construction of 8-inch sewer along Canoga Avenue from Candice Pl to Celtic St per the sewer study Report
- Additional requirements such as installation of gauging equipment may be required in order for the City to Bill for Sewer Service Charges.
- Operation of the pumping infrastructure at P1 will not be in the Jurisdiction of the City.

Further detailed gauging and evaluation will be needed as part of the permit process to identify a specific sewer connection point. If the public sewer has insufficient capacity then the developer will be required to build sewer lines to a point in the sewer system with sufficient capacity. A final approval for sewer capacity and connection permit will be made at that time. Ultimately, this sewage flow will be conveyed to the Hyperion Treatment Plant, which has sufficient capacity for the project.

If you have any questions, please call Kwasi Berko of my staff at (323) 342-1562.

STORMWATER REQUIREMENTS

The LA Sanitation, Watershed Protection Division (WPD) is charged with the task of ensuring the implementation of the Municipal Stormwater Permit requirements within the City of Los Angeles. We anticipate the following requirements would apply for this project.

POST-CONSTRUCTION MITIGATION REQUIREMENTS

The project requires implementation of stormwater mitigation measures. These requirements are based on the Standard Urban Stormwater Mitigation Plan (SUSMP) and the recently adopted Low Impact Development (LID) requirements. The projects that are subject to SUSMP/LID are required to incorporate measures to mitigate the impact of stormwater runoff. The requirements are outlined in the guidance manual titled "*Development Best Management Practices Handbook – Part B: Planning Activities*". Current regulations prioritize infiltration, capture/use, and then biofiltration as the preferred stormwater control measures. The relevant documents can be found at: www.lastormwater.org. It is advised that input regarding SUSMP requirements be received in the early phases of the project from WPD's plan-checking staff.

GREEN STREETS

The City is developing a Green Street Initiative that will require projects to implement Green Street elements in the parkway areas between the roadway and sidewalk of the public right-of-away to capture and retain stormwater and urban runoff to mitigate the impact of stormwater runoff and other environmental concerns. The goals of the Green Street elements are to improve the water quality of stormwater runoff, recharge local ground water basins, improve air quality, reduce the heat island effect of street pavement, enhance pedestrian use of sidewalks, and encourage alternate means of transportation. The Green Street elements may include infiltration systems, biofiltration swales, and permeable pavements where stormwater can be easily directed from the streets into the parkways and can be implemented in conjunction with the SUSMP/LID requirements.

CONSTRUCTION REQUIREMENTS

The project is required to implement stormwater control measures during its construction phase. All projects are subject to a set of minimum control measures to lessen the impact of stormwater pollution. In addition for projects that involve construction during the rainy season that is between October 1 and April 15, a Wet Weather Erosion Control Plan is required to be prepared. Also projects that disturb more than one-acre of land are subject to the California General Construction Stormwater Permit. As part of this requirement a Notice of Intent (NOI) needs to be filed with the State of California and a Storm Water Pollution Prevention Plan (SWPPP) needs to be prepared. The SWPPP must be maintained on-site during the duration of construction.

If there are questions regarding the stormwater requirements, please call Kosta Kaporis at (213) 485-0586, or WPD's plan-checking counter at (213) 482-7066. WPD's plan-checking counter can also be visited at 201 N. Figueroa, 3rd Fl, Station 18.

SOLID RESOURCE REQUIREMENTS

The City has a standard requirement that applies to all proposed residential developments of four or more units or where the addition of floor areas is 25 percent or more, and all other development projects where the addition of floor area is 30 percent or more. Such developments must set aside a recycling area or room for onsite recycling activities. For more details of this requirement, please contact Daniel Hackney of the Special Project Division at (213)485-3684.

Sincerely,

Ali Poosti, Division Manager
Wastewater Engineering Services Division

CONDITIONAL STATEMENT OF SEWER SERVICE

TO WHOM IT MAY CONCERN:

SUBJECT: T 53138 Deerlake

This is to advise you that the above tract sewer service will be served by Las Virgenes Municipal Water District.

This project will be assured of connection to the sewer system of the district only if the proponent satisfies all terms and conditions for service as set forth in the district's Code.

Sincerely,

Joanne Bodenhamer
Planning & New Development Technician
